VSR	Validation Summary Report

1.0 Introduction

The former Fort Ord, located in northern Monterey County, California (Figure 1) was an active U.S. Army base from 1917 to 1994 encompassing approximately 28,000 acres. The U.S. Environmental Protection Agency (USEPA) added Fort Ord to the National Priorities List primarily on the basis of groundwater contamination discovered in 1990 beneath the Fort Ord Landfills area, which was subsequently designated as Operable Unit 2 (OU2). Fort Ord was placed on the Base Realignment and Closure list in 1991. As the lead agency, the U.S. Department of the Army (Army) manages the cleanup of the former Fort Ord in accordance with the Comprehensive Environmental Response, Compensation, and Liability Act, commonly known as Superfund. Activities include conducting risk assessments, remedial investigations, feasibility studies, and implementation of selected remedies for site cleanup of hazardous substances released into the environment as a result of previous Army activities. The remedial alternative and cleanup goals are selected in a decision document, and remedial activities are initiated accordingly. Monitoring of remedial activities ensures the remedy is operating properly and successfully to achieve cleanup goals.

The quarterly groundwater monitoring program (GWMP) at the former Fort Ord began in 1993 as a result of a Basewide Remedial Investigation/Feasibility Study (RI/FS) conducted in accordance with the Federal Facility Agreement. The Federal Facility Agreement became effective November 19, 1990, after it was signed by representatives of the Army, USEPA Region 9, the California Department of Health Services (now the California Department of Toxic Substances Control [DTSC]), and the California Regional Water Quality Control Board, Central Coast Region (CCRWQCB). The GWMP currently includes monitoring the progress of remedial actions at three sites: Sites 2 and 12 (Sites 2/12), OU2, and Operable Unit Carbon Tetrachloride Plume. This report summarizes remedial activities and monitoring at Sites 2/12.

The quarterly GWMP includes measuring depth to water and collecting groundwater samples for chemical analysis from groundwater monitoring and extraction wells at Sites 2/12 (Figure 1).[1] The presence and concentration of groundwater chemicals of concern (COCs) in wells associated with Sites 2/12 are compared with each COC's Aquifer Cleanup Level (ACL) to determine their horizontal and vertical distribution in the aquifers. Table 1 lists the ACLs for Sites 2/12 groundwater COCs as stated in the *Final Record of Decision, Basewide Remedial Investigation Sites, Fort Ord, California* (RI Sites ROD; Army, 1997) and the *Explanation of Significant Differences No. 1, Basewide Remedial Investigation Sites 2 and 12, Former Fort Ord, California* (ESD No. 1; Army, 2016). Groundwater elevations and flow

[1] Groundwater well names are referenced throughout this report according to a Fort Ord-specific naming convention (ST-SS-00-XXX), where ST = monitoring station type, SS = site identification code, 00 = monitoring station number, and XXX = monitoring depth or aquifer designation. Monitoring station type codes (ST) are EW = extraction well, MW = monitoring well, PZ = piezometer, and TS = treatment system. Site identification codes are 02 = Site 2 and 12 = Site 12. Monitoring depths are expressed as feet below ground surface or aquifer designations, which are 180 = Upper 180-Foot Aquifer generally, 180U = the upper zone of the unconfined Upper 180-Foot Aquifer, 180M = the middle zone of the unconfined Upper 180-Foot Aquifer, and 180L = the lower zone of the unconfined Upper 180-Foot Aquifer. For example, well name EW-12-08-180U represents Site 12 extraction well number 8 that is screened in the upper zone of the unconfined Upper 180-Foot Aquifer.

directions are determined using depth to water measurements collected during the quarterly GWMP events.

The quarterly soil gas monitoring program (SGMP) at Sites 2/12 began in the First Quarter 2015 after an RI/FS Addendum was conducted as presented in the *Final Remedial Investigation/Feasibility Study Addendum at Sites 2 and 12, Former Fort Ord, California* (RI/FS Addendum; AES, 2015). The SGMP includes collecting soil gas samples for chemical analysis from soil gas probes and soil vapor extraction (SVE) wells associated with Sites 2/12.[2] The presence and concentration of soil gas COCs in wells associated with Sites 2/12 are compared with each COC's Soil Gas Cleanup Level (SGCL) to determine their horizontal and vertical distribution in the vadose zone. Table 2 lists the SGCLs for Sites 2/12 soil gas COCs, as stated in the ESD No. 1 (Army, 2016).

Project activities were performed according to the following documents:

- *Quality Assurance Project Plan, Former Fort Ord, California, Volume I, Appendix A, Final Revision 7, Groundwater Remedies and Monitoring at Operable Unit 2, Sites 2 and 12, and* Operable Unit Carbon Tetrachloride Plume (Groundwater QAPP; AEI, 2019e)
- Quality Assurance Project Plan, Volume I, Appendix C, Final Revision 4, Soil Gas Monitoring at Sites 2 and 12, Former Fort Ord, California (Soil Gas QAPP; AEI, 2019a)
- *Final Operations and Maintenance Manual Volume II, Sites 2 and 12 (Sites 2/12) Groundwater Remedy, Former Fort Ord, California* (GWTS O&M Manual; AES, 2009) including Section 2.5.3 Replacement Pages (AEI, 2015a)
- Final Operations and Maintenance Manual Volume III, Sites 2 and 12 Soil Vapor Extraction and Treatment System, Former Fort Ord, California (SVETS O&M Manual; AEI, 2015c)
- *Accident Prevention Plan, Groundwater Remedies and Monitoring at Operable Unit 2, Sites 2 and 12, and* Operable Unit Carbon Tetrachloride Plume*; and Soil Gas Remedy and Monitoring at Sites 2 and 12, Former Fort Ord, California* (AEI, 2015b) and associated Activity Hazard Analyses

1.1 Purpose of this Report

Ahtna Global, LLC prepared this *Sites 2 and 12 Fourth Quarter 2018 through Third Quarter 2019 Groundwater and Soil Gas Monitoring and Treatment System Report* on behalf of the U.S. Army Corps of Engineers (USACE) Sacramento District, per Contract W91238-19-C-0027. This report documents the groundwater and soil gas remediation and monitoring activities conducted at Sites 2 and 12 (Sites 2/12) in the former Fort Ord, California (Figure 1) from October 1, 2018 through September 30, 2019 (the "reporting period"). The guidance contained in the *O&M Report Template for Ground Water Remedies (with Emphasis on Pump and Treat Systems)* (USEPA, 2005) was utilized in preparing this report.

[2] Soil gas well names are referenced throughout this report according to a Fort Ord-specific naming convention (ST-SS-00-XX), where ST = monitoring station type, SS = site identification code, 00 = monitoring station number, and XX = monitoring depth (if applicable). Monitoring station type codes (ST) are SG = soil gas probe, VE = soil vapor extraction well, and TS = treatment system. The site identification code 12 = Site 12. Monitoring depths are expressed as feet below ground surface. For example, well name SG-12-01-10 represents Site 12 soil gas probe number 1 that is screened at 10 feet below ground surface.

The Sites 2/12 groundwater remedy includes a groundwater treatment system (GWTS)[3] in operation since April 1999 to remediate the Sites 2/12 unconfined Upper 180-Foot Aquifer and a soil vapor extraction and treatment system (SVETS)[4] in operation since September 2015 to remediate the Sites 2/12 vadose zone. The GWTS (Figure 1) extracts groundwater from the unconfined Upper 180-Foot Aquifer and treats it with liquid-phase granular activated carbon (GAC) and air stripping at the Sites 2/12 groundwater treatment plant (GWTP) shown in Figure 2. The SVETS (Figure 3) extracts soil gas from the vadose zone and treats it with vapor-phase GAC at the Sites 2/12 soil vapor treatment unit (SVTU) shown in Figure 4.

This report presents:

- Sites 2/12 GWTS and SVETS operations and maintenance (O&M) data.
- Sites 2/12 GWMP and SGMP data.
- Detailed discussions of GWMP and SGMP results and GWTS and SVETS performance, including groundwater COC plume capture analysis.
- Recommendations for system modifications to improve performance, reduce costs, and/or increase the likelihood of site closeout.

1.2 Brief Summary of Conceptual Site Model

When the former Fort Ord was an active military facility, Site 2 consisted of the primary sewage treatment facility for Fort Ord and Site 12 included numerous industrial activities, including vehicle maintenance and repair, furniture repair, storage of motor oils, hazardous material storage, vehicle cleaning and degreasing, and disposal of waste and oil. The source of the Sites 2/12 groundwater COC plume is assumed to be historical use and improper disposal of solvents in the Site 12 area. The Upper 180-Foot Aquifer COC plume appeared to have originated from Site 12 and was subsequently transported over 3,000 feet to the southwest by groundwater flow, passing beneath State Route 1 and into the Site 2 area. The two primary Sites 2/12 groundwater COCs are tetrachloroethene (PCE) and trichloroethene (TCE), which are constituents used to define the extent of the groundwater plume. The PCE and TCE ACLs are both 5 micrograms per liter (µg/L).

The groundwater aquifer of interest within Sites 2/12 is the unconfined Upper 180-Foot Aquifer, which consists primarily of sandy deposits with some gravel. Depth to groundwater in the Upper 180-Foot Aquifer is between 45 and 260 feet below ground surface across the northern part of the former Fort Ord, and between 45 and 95 feet below ground surface in the Sites 2/12 area. Groundwater in the Upper 180-Foot Aquifer generally flows southwest. A north-trending groundwater divide in the unconfined Upper 180-Foot Aquifer occurs about midway between the Fort Ord Salinas Valley Aquitard (FO-SVA) edge and Monterey Bay. The source area of Sites 2/12 is west of this divide. Groundwater west

[3] The GWTS is comprised of the groundwater extraction system (extraction wells and conveyance), the groundwater treatment plant (GWTP), including controls and treatment equipment, and the treated groundwater conveyance and injection/infiltration systems.

[4] The SVETS is comprised of the soil vapor extraction system (extraction wells and conveyance) and the soil vapor treatment unit (SVTU), including controls and treatment equipment.

of this Upper 180-Foot Aquifer divide flows west to discharge into Monterey Bay, and groundwater to the east flows beneath the FO-SVA (confined) toward the Salinas Valley.

The Sites 2/12 conceptual model was updated as part of the 2015 RI/FS Addendum at Sites 2/12, which included an investigation of the extent of PCE and TCE present in soil gas in the vadose zone above the groundwater. The results of the RI/FS Addendum and the updated conceptual site model are presented in the RI/FS Addendum Report (AES, 2015). There are or have been four potential migration pathways specific to Sites 2/12:

- Leaching of chemicals into underlying unsaturated zone soil
- Diffusion of vapor-phase chemicals in soil gas
- Partitioning of chemicals between soil gas and groundwater
- Migration of dissolved phase chemicals in groundwater

Based on environmental conditions, historical data at Sites 2/12, and chemical-specific properties, PCE and TCE are considered to have medium to high persistence and moderate mobility. Soil types present at the site have a low retardation factor, and there is insignificant adsorption of these chemicals. Additionally, PCE and TCE water solubilities and partition coefficients indicate moderate mobility. Persistence of PCE and TCE over time and the relative absence of breakdown products indicate little or no reductive dechlorination of these compounds. Concentration-driven diffusion is likely a continuing process at Site 12 given the variation of concentration gradients in the unsaturated zone over time. Additionally, groundwater and soil gas analytical data and modeling during the RI/FS Addendum at Sites 2/12 indicated the areas of highest concentrations of PCE and TCE in soil gas were associated with concentrations of PCE and TCE in groundwater that exceed ACLs (AES, 2015).

Diffusion of the soil gas PCE plume resulted in expansion downward to the water table, where PCE moved from the vapor phase into the groundwater by dissolving into water infiltrating through the capillary fringe. PCE partitioned between soil gas and groundwater as it moved toward equilibrium in the two media. The SVETS was turned off in February 2019 for a rebound study and was not operated during the remainder of the reporting period. PCE in soil gas does not appear to be affecting groundwater concentrations (AEI, 2019d and 2019f). Additionally, PCE concentrations in groundwater were below the ACL at Sites 2/12 during the reporting period, except for two well locations (Section 4.5).

TCE in soil gas does not appear to be affecting groundwater concentrations following the SVE and air sparging pilot study completed in June 2014 (AES, 2015). Additionally, TCE in groundwater was below the ACL at Sites 2/12 during the reporting period (Section 4.5).

As described in the RI/FS Addendum Report (AES, 2015), the Sites 2/12 soil gas plume is characterized by the presence of PCE and TCE in soil gas at concentrations above their respective SGCLs (Table 2). PCE and TCE concentrations are used to define the extent of the soil gas plume in the Sites 2/12 area, with associated SGCLs of 1,800 micrograms per cubic meter ($\mu g/m^3$) and 1,000 $\mu g/m^3$, respectively. The vadose zone thickness at Site 12 (excluding Site 2) varies with the depth to groundwater at approximately 63 to 88 feet below ground surface. PCE and TCE in soil gas were below their SGCLs at Sites 2/12 during the reporting period (Section 5.5).

1.3 Statement of Remedy Goals and Conditions for Terminating the Groundwater Remedy

Groundwater at Sites 2/12 is considered a potential drinking water, industrial water, and agricultural water source under the *Water Quality Control Plan for the Central Coastal Basin* (CCRWQCB, 2019), although the water is not currently being used for these purposes. Accordingly, the Sites 2/12 groundwater remedy goals are to protect human health and comply with Federal and State law by returning groundwater to a condition that will allow beneficial use, including potential future use as a drinking water source as described in the RI Sites ROD (Army, 1997) and the subsequent ESD No. 1 (Army, 2016). Specifically, the remedial action objective (RAO) is to remediate COCs in the Upper 180-Foot Aquifer to Federal or State drinking water Maximum Contaminant Levels, whichever is lower, and risk-based levels that are lower than Maximum Contaminant Levels for Chloroform and Vinyl Chloride (Army, 1997). These goals are accomplished through hydraulic control and containment of contaminated groundwater, and through extraction and treatment of groundwater exceeding ACLs. The treated water is injected to recharge the aquifer and maintain a groundwater mound to minimize saltwater intrusion at Site 2. The RAO is also met by SVE and treatment at Site 12 to reduce COC concentrations in soil gas to levels that will not result in concentrations of COCs in groundwater that continue to exceed ACLs. It is further stated in the RI Sites ROD that the achievement of the RAO would restore the beneficial uses of groundwater within and adjacent to Sites 2/12 and the ACLs are acceptable contaminant concentrations that, when achieved, would reduce potential risks and comply with applicable or relevant and appropriate requirements.

The Sites 2/12 groundwater plume is characterized by the presence of eight COCs in groundwater in the Upper 180-Foot Aquifer at concentrations above their respective ACLs. Table 1 presents the ACLs and treated water discharge limits in effect during the reporting period.

Criteria for terminating the groundwater remedy are based on decision rules identified in the Groundwater QAPP (AEI, 2019e). Groundwater monitoring wells and extraction wells are sampled quarterly during the remediation monitoring phase.[5] The remediation monitoring phase is complete, and the attainment monitoring phase[3] begins when four consecutive quarters of monitoring data show concentrations of all COCs in a well are less than or equal to their respective ACLs. The attainment monitoring phase for a well is complete when concentrations of all COCs in the well meet one of the following statements:

- COC concentrations are less than or equal to their respective ACLs in eight consecutive monitoring events and data analysis indicates COC concentrations are stable or declining,[6] or
- COC concentrations are below their respective limits of quantitation or below 10 percent of their respective ACLs, whichever is greater, in six consecutive monitoring events.

When the attainment monitoring phase for a well is completed, the well may be removed from the sampling program. If the well is no longer needed for groundwater elevation data, it will be proposed for

[5] As defined in *Recommended Approach for Evaluating Completion of Groundwater Restoration Remedial Actions at a Groundwater Monitoring Well* (USEPA, 2014).

[6] The eight consecutive monitoring events may include monitoring events completed during the remediation monitoring phase.

decommissioning. The groundwater remedy termination metric to be evaluated will be whether the attainment monitoring phase is complete for all wells at Sites 2/12, at which point operation of groundwater extraction (GWE) wells may be terminated. This approach recognizes the termination metric will likely not be met simultaneously throughout all areas of the plume. Thus, the operation of GWE wells within individual hydraulic capture zones will progressively come to an end when the operation of the entire Sites 2/12 GWTS is terminated, and closure of the Sites 2/12 groundwater remedy will be proposed in a remedial action completion report.

1.4 Remedy Description

The Sites 2/12 groundwater remedy is defined by the RI Sites ROD (Army, 1997) and the subsequent ESD No. 1 (Army, 2016), and consists of a groundwater pump and treatment system designed to remediate groundwater containing COCs above ACLs and an SVE system designed to remediate soil gas containing COCs above SGCLs. In a letter dated July 3, 2002, the USEPA concurred with the Army's determination that the Sites 2/12 groundwater remedy is "operating properly and successfully" (USEPA, 2002). Components of the Sites 2/12 GWTS and SVETS and a brief history are described below.

1.4.1 Groundwater Pump and Treat System Description

Construction of the original Sites 2/12 groundwater remedy is documented in the *Final Construction Completion Report, Sites 2 and 12 Groundwater Remedy, Fort Ord, California* (IT, 1999). Groundwater extraction and treatment first occurred at Sites 2/12 on April 13, 1999. Continuous groundwater extraction and treatment began on May 3, 1999 (IT, 2000). Diversion of treated effluent water from the OU2 GWTP to the Site 2 aquifer recharge structures began on June 23, 1999.

The Sites 2/12 groundwater remedy currently consists of the GWTP[7], eight GWE wells located at Site 12, and two injection wells and three infiltration galleries located at Site 2 (Figure 1). GWE wells at Sites 2/12 are screened either in the upper or lower part of the Upper 180-Foot Aquifer. GWE wells, designated with a "U" suffix, extract groundwater from the upper portion of the aquifer. Wells designated with an "M" suffix extract groundwater from the lower portion of the aquifer. Eight GWE wells, four in the upper portion of the aquifer (EW-12-01-180U through EW-12-04-180U) and four in the lower portion of the aquifer (EW-12-01-180M through EW-12-04-180M), were installed in 1997 and 1998 as the original GWE network. Ongoing development activities in the Site 12 area were accommodated by decommissioning four GWE wells (EW-12-01-180U, EW-12-01-180M, EW-12-02-180U, and EW-12-02-180M), and installing three GWE wells (EW-12-05-180M, EW-12-06-180M, and EW-12-07-180M) in 2006. One GWE well (EW-12-08-180U) was installed in 2015 to provide additional capture of the PCE groundwater plume.

System operations consist of Upper 180-Foot Aquifer groundwater extraction from wells at Site 12. Extracted groundwater is piped to the Sites 2/12 GWTP (Figure 2). COCs are then removed by adsorption to liquid-phase GAC and secondary treatment by an air stripper. A portion of the treated water from the OU2 groundwater remedy is piped to the Sites 2/12 GWTP and added to the Sites 2/12 treated water in

[7] The GWTP is a component of the GWTS and houses system controls and treatment equipment, including the GAC vessels and the air stripper.

the effluent tank before the combined stream is transferred to the Upper 180-Foot Aquifer Site 2 aquifer recharge structures. The five Site 2 recharge structures consist of two injection wells (IW-02-01-180 and IW-02-02-180) and three infiltration galleries (INF-02-01-180, INF-02-02-180, and INF-02-03-180) (Figure 1).

The original groundwater remedy was designed to extract groundwater from Site 12 at a system rate of about 300[8] gallons per minute (gpm) and recharge the Upper 180-Foot Aquifer at a total system rate of about 600 gpm. The additional 300 gpm of aquifer recharge water is provided by the OU2 system. The aquifer extraction and recharge system is designed to reverse the natural westerly groundwater flow gradient by redirecting the flow toward the east and facilitate groundwater flow from Site 2 to the Site 12 GWE wells. The extraction capacity of the four operable GWE wells[9] was designed to allow for maximum system operation flexibility in the event extraction at a well would need to be reduced or discontinued. The loss of extraction capacity could be compensated for by increasing the extraction rate at another well.

The Sites 2/12 GWTP is located in the southern part of the 2/12 plume area and consists of two 10,000-pound liquid-phase GAC vessels and an air stripper (Figure 2).[10] During treatment, groundwater is pumped from the GWE wells and piped directly through one of the GAC vessels and the air stripper operated in series to remove COCs. The treated water flows to an effluent storage tank that discharges, with the aid of pumps controlled by variable frequency drives, to groundwater infiltration and injection structures located at Site 2. The capacity of the Sites 2/12 GWTP with the GAC vessels and air stripper in series (225 gpm) is the practical maximum flow rate that allows for adequate residence time in the air stripper. The air stream effluent from the air stripper is treated by potassium permanganate prior to discharge to the atmosphere. Schematic diagrams of the equipment arrangements and sampling locations during the reporting period are shown in Figure 2.

1.4.2 Soil Vapor Extraction and Treatment System Description

Construction of the Sites 2/12 soil gas remedy is documented in the SVETS O&M Manual (AEI, 2015c). Soil vapor extraction and treatment first occurred at Sites 2/12 on May 9, 2014, as part of a pilot study performed with five SVE wells (VE-12-01 through VE-12-05) over 38 days (AES, 2015). Continuous SVE and treatment began on September 14, 2015 with the full-scale system.

The Sites 2/12 SVETS is a component of the groundwater remedy and currently consists of the SVTU[11] and ten SVE wells located at Site 12 (Figure 3). SVE wells at Sites 2/12 are screened either in the middle or lower part of the vadose zone. Five SVE wells, three screened in the lower portion of the vadose zone (VE-12-01 through VE-12-03) and two screened in the middle portion of the vadose zone (VE-12-04 and VE-12-05), were installed in 2014 as the original SVE pilot study network. Five SVE wells screened in the

[8] The addition of the air stripper resulted in a reduced design flow rate of approximately 225 gpm.
[9] EW-12-05-180M, EW-12-06-180M, EW-12-07-180M, and EW-12-08-180U.
[10] One GAC vessel is inoperable due to an underdrain assembly failure that occurred in April 2017.
[11] The SVTU is a component of the SVETS and houses system controls and treatment equipment including the GAC vessels.

lower portion of the vadose zone (VE-12-06 through VE-12-10) were installed in 2015 as part of the full-scale soil gas remedial system and are located to the north of the original SVE pilot study network.

System operations consist of vadose zone soil gas extraction from SVE wells at Site 12. Extracted soil gas is piped to the 2/12 SVTU where, prior to treatment, the soil gas undergoes condensate removal via liquid separation (Figure 4). COCs are then removed by adsorption to vapor-phase GAC and treated soil gas is vented to the atmosphere. The 2/12 SVTU is located in a compound adjacent to the Sites 2/12 GWTP and consists of a positive displacement blower (vacuum pump) and two 3,000-pound vapor-phase GAC vessels operated in series (Figure 4). As soil gas COC concentrations were below SGCLs, the SVTU was turned off in February 2019 (AEI, 2019d) and remained off for the rest of the reporting period with the concurrence of USEPA, DTSC, and CCRWQCB (collectively the "regulatory agencies") because soil gas COC concentrations remained below SGCLs.

1.4.3 Other Remedy Components

As specified in the RI Sites ROD (Army, 1997), the remedy includes institutional controls (i.e., deed restrictions) to prevent the use of groundwater within the contaminant plume for domestic or agricultural purposes.

2.0 GWTS Operations Summary

Operating performance of the Sites 2/12 GWTS is discussed below regarding extraction and treatment flow rates and totals, online effectiveness, non-routine operations, and indirect waste stream production. Flow rates and totals for the reporting period are presented in Table 3 and Figure 5. Treatment system operations were conducted following procedures in the GWTS O&M Manual (AES, 2009).

2.1 System Downtime

The Sites 2/12 GWTP was operational 72.9 percent of the time during the reporting period (Table 3), which is below the operational goal of 95 percent, but was operational 94 percent of the time during the Third Quarter 2019 (Table 3). Downtime includes scheduled and unscheduled operational outages, including maintenance.

2.1.1 Routine

Sites 2/12 GWTP downtime associated with scheduled operational shutdowns during the reporting period was approximately 3 hours during the reporting period for a GAC change-out on June 4, 2019.

2.1.2 Non-Routine

Sites 2/12 GWTP downtime associated with unscheduled operational shutdowns during the reporting period was approximately 2,384 hours, which warranted corrective actions during the reporting period (see Section 2.4). The following table summarizes non-routine events resulting in Sites 2/12 GWTP downtime during the reporting period.

Non-Routine Events Resulting in System Downtime

Date	Non-Routine Events	Duration (Hours)
10/12/2018-02/06/2019	Sites 2/12 GWTP was online during business hours only. This was due to loss of supervisory control and data acquisition (SCADA) system communications during and after OU2 transition period.[12]	1,941.4
03/5/2019-03/12/2019	Sites 2/12 GWTP was offline intermittently due to a programmable logic controller (PLC) and communications issues.	128.0
03/15/2019-03/19/2019	Sites 2/12 GWTP was offline due to a leak in effluent pipeline, which was repaired on March 19, 2019.	88.5
03/22/2019	Sites 2/12 GWTP was offline due to the OU2 GWTP communications error.	12.0
03/26/2019	Sites 2/12 GWTP was offline due to the Pacific Gas & Electric power issue at OU2 GWTP.	5.0

[12] The OU2 transition period was from October 12, 2018, when the old OU2 GWTP was permanently shut down, to November 30, 2018, when the new OU2 GWTP started full operation; however, Sites 2/12 GWTS SCADA system communications were not restored until February 6, 2019, after which the Sites 2/12 GWTP resumed fulltime operations.

Date	Non-Routine Events	Duration (Hours)
04/02/2019	Sites 2/12 GWTP was offline for the repair of a leaking effluent pipe flange near old OU2 GWTP (repaired by RORE Innovative Solutions Joint Venture [JV]).	3.0
04/10/2019	Sites 2/12 GWTP was offline for the repair of a leaking effluent pipe flange near old OU2 GWTP (repaired by JV).	3.0
04/12/2019	Sites 2/12 GWTP was offline for maintenance of a leak detection system at OU2 eastern network extraction wells.	12.0
04/27/2019	Sites 2/12 GWTP was offline due to communications loss at the OU2 GWTP.	19.0
05/03/2019	Sites 2/12 GWTP was offline due to communications loss at the OU2 GWTP.	14.0
05/07/2019	Sites 2/12 GWTP was offline due to communications loss at the OU2 GWTP.	12.0
05/13/2019	Sites 2/12 GWTP was offline to repair a broken effluent pipe air vacuum valve at Site 2.	2.5
06/28/2019	Sites 2/12 GWTP was offline due to communications loss at OU2 GWTP.	2.0
07/07/2019	Sites 2/12 GWTP was offline due to a power outage. EW-12-05-180M was online, EW-12-08-180U was unable to restart due to a fault caused by power outage.	0.25
07/16/2019-07/22/2019	Sites 2/12 GWTP was shut down until the EW-12-08-180U could be repaired. Operation of only EW-12-05-180M may augment plume migration and reduce capture. EW-12-08-180U was repaired, and Sites 2/12 GWTP restarted on July 22, 2019.	141.0
	Total Sites 2/12 GWTP Non-Routine Downtime:	**2,383.7**

2.2 Operational Data and Process Monitoring Data

2.2.1 Plant Influent and Effluent, and Efficiency of Aboveground Components

This section presents an evaluation of treatment system monitoring data and efficiency of aboveground treatment components during the reporting period. Chemical concentrations are monitored at up to five sampling locations at the Sites 2/12 GWTP. The sample station designations and descriptions are listed in the table below and shown in Figure 2.

Sample Station Designations and Descriptions

Station Designation	Description
TS-212-INF	Combined untreated influent groundwater from online GWE wells for calculating total COC mass removal and monitoring treatment effectiveness.
TS-212-GAC-A & TS-212-GAC-B	GAC vessels TK-5450A and TK-5450B effluent stations for monitoring COC breakthrough to determine if a GAC change-out is required.
TS-212-EFF	Air stripper TK-5460 effluent station for monitoring treatment effectiveness.

Station Designation	Description
TS-212-INJ	Combined treated water from the OU2 and Sites 2/12 GWTPs. Compliance monitoring point for comparison to treated water discharge limits (Table 1) before aquifer recharge.

The Sites 2/12 GWTP process monitoring schedule is presented in Table 4 and COC analytical data are presented in Table 5. The Sites 2/12 GWTP process monitoring is conducted according to the schedule in the Groundwater QAPP (AEI, 2019e). Analytical data generated during the reporting period were subjected to validation in accordance with the Groundwater QAPP (AEI, 2019e) and are considered acceptable and suitable for use. The Validation Summary Report (VSR) for these analytical data is in Appendix B.

2.2.1.1 Flow Rates and Total Volume Treated

During the reporting period, except when offline, the Sites 2/12 GWTP operated continuously in the automatic control mode utilizing one GAC treatment vessel (TK-5450A) and the air stripper (TK-5460). The flow rate and treated volume data for the reporting period are summarized in Table 3. The total volume of treated groundwater for the reporting period was approximately 51.3 million gallons. The average flow rate for the reporting period was 98 gpm. The reported average monthly flow rate varies depending on flow rates for individual GWE wells and downtime events at the GWTP or the GWE wells. Cumulative treated groundwater flow since startup on April 13, 1999 through September 30, 2019 was approximately 2.1 billion gallons. Total system flow rates and design flow rates since system startup are shown graphically in Figure 5.[13]

Treated water is discharged into five separate Upper 180-Foot Aquifer recharge structures, consisting of two injection wells and three infiltration galleries at Site 2 (Figure 1). During the reporting period, the Sites 2/12 GWTS discharged treated water from both Sites 2/12 and OU2 to the five aquifer recharge structures at an average rate of 465 gpm.

2.2.1.2 Influent Monitoring

The combined Sites 2/12 GWTP influent is sampled at TS-212-INF prior to entering the GAC vessels (Figure 2). Table 3 summarizes total influent COC concentrations (i.e., the sum of detected COC concentrations at the Sites 2/12 GWTP influent) during the reporting period, and specific influent COC concentrations are presented in Table 5. A historical summary of influent COC concentrations is shown graphically in Figure 6. Four COCs were detected in the Sites 2/12 GWTP influent during the reporting period: chloroform; cis-1,2-dichloroethene (cis-1,2-DCE); PCE; and TCE. During the reporting period, the highest detected concentration of any COC in the influent samples was PCE at 8.1 µg/L in the sample collected on December 3, 2018. PCE was the only COC detected above its ACL in the Sites 2/12 GWTP influent during the reporting period.

[13] Figure 5 indicates a decreasing trend in total flow rate since 2012. This is primarily due to discontinued operation of specific GWE wells, where COC concentrations are consistently below ACLs, and operational modifications to address the PCE plume identified in 2011 (see evaluation in Table 7).

2.2.1.3 Effluent Monitoring

The treatment plant effluent is sampled at TS-212-EFF (Figure 2) after treatment through the GAC vessel and the air stripper. Four COCs were detected at the effluent monitoring point during the reporting period: chloroform; cis-1,2-DCE; PCE; and TCE (Table 5). Concentrations of all detected COCs were below ACLs (Table 1).

2.2.1.4 Discharge Compliance Monitoring

Discharge compliance monitoring during normal operations is conducted as specified in the Groundwater QAPP (AEI, 2019e) to document compliance with treated discharge water requirements for aquifer recharge and evaluate the effects of adding treated effluent from the OU2 GWTP. Injection monitoring samples are collected at TS-212-INJ (Figure 2). Three COCs were detected at the injection monitoring point during the reporting period: cis-1,2-DCE; PCE; and TCE (Table 5). All detections were below discharge limits (Table 1).

2.2.1.5 GAC Performance Monitoring

The Sites 2/12 GWTP was operated with one 10,000-pound GAC vessel online during the reporting period. Groundwater was pumped from the GWEs and piped through GAC vessel TK-5450A (Figure 2).

The monitoring data are used to assess COC breakthrough and determine when GAC needs to be changed per Groundwater QAPP decision rules (AEI, 2019e). The GAC vessel effluent (sampled at TS-212-GAC-A) was sampled during the reporting period and four COCs were detected: chloroform; cis-1,2-DCE; PCE; and TCE (Table 5).

GAC performance monitoring is evaluated by comparing the Sites 2/12 GWTP influent (TS-212-INF) and GAC vessel (TS-212-GAC-A) TCE and PCE concentrations, and is used to calculate GAC efficiency.[14] GAC vessel COC removal efficiency was calculated at 20 percent for TCE and 45 percent for PCE during the reporting period (Table 6).

2.2.1.6 Air Stripper Performance Monitoring

Air stripper performance monitoring is evaluated by comparing GAC vessel (TS-212-GAC-A) and Sites 2/12 GWTP effluent (TS-212-EFF) TCE and PCE concentrations, and is used to calculate air stripper efficiency. Air stripper COC removal efficiency was calculated at 63 percent for TCE and 67 percent for PCE during the reporting period (Table 6).

2.2.1.7 Groundwater Treatment System Efficiency

GWTS performance monitoring is evaluated by comparing Sites 2/12 GWTP influent (TS-212-INF) and effluent (TS-212-EFF) TCE and PCE concentrations, and is used to calculate GWTS efficiency. Sites 2/12 GWTP COC removal efficiency was calculated at 71 percent for TCE and 83 percent for PCE during the reporting period (Table 6).

[14] For the Sites 2/12 GWTP performance monitoring, only TCE and PCE are evaluated as they are the primary COCs and the determining COCs for scheduling GAC change-outs in accordance with the decision rules in the Groundwater QAPP (AEI, 2019e).

2.2.1.8 COC Mass Removed

The Sites 2/12 GWTP removed 3.2 pounds of COCs during the reporting period and a cumulative 488 pounds since system startup in April 1999 (Table 3 and Figure 7). PCE and TCE are estimated to represent approximately 92 percent by weight of the total COCs in the untreated influent (TS-212-INF) during the reporting period (Table 5). The remaining 8 percent is estimated to be a combination of chloroform and cis-1,2-DCE. The remaining COCs (1,1-dichloroethene [1,1-DCE]; 1,2-dichloroethane [1,2-DCA]; total 1,3-dichloropropene [total 1,3-DCP]; and vinyl chloride) were not detected (ND) at the Sites 2/12 GWTP influent during the reporting period.

2.2.2 Extraction Well Data

GWE wells are typically monitored quarterly.[15] GWE well locations are shown in Figure 1. Operational run time, flow rates, volume pumped, and total COC concentrations for individual GWE wells are reported in Table 7. A brief evaluation of individual GWE well performance during the reporting period and recommendations for the next reporting period are presented in Table 8. The GWE well sample schedule is presented in Table 9 and any modifications to the schedule during the reporting period are listed in Table 10. Well maintenance conditions and status are listed in Table 11. Depth to water measurements and groundwater elevations are listed in Table 12. Specific COC analytical data for each GWE well during the reporting period are presented in Tables 13 through 17. Analytical data generated during this reporting period were subjected to validation as described in the Groundwater QAPP (AEI, 2019e) and are considered acceptable and suitable for use. The VSR for these analytical data is presented in Appendix B.

2.3 Consumables and Waste Handling/Disposal

2.3.1 Consumables Used

One GAC change-out event occurred during the reporting period. On June 4, 2019, the spent GAC in TK-5450A was replaced with reactivated 8 x 30 mesh GAC supplied by Evoqua Water Technologies (Evoqua) from previous Sites 2/12 GWTP change-outs.

2.3.2 Waste Handling/Disposal

Evoqua transported the spent GAC removed during the change-out event to its facility in Red Bluff, California for reactivation. Spent Sites 2/12 GWTP GAC is a Resource Conservation and Recovery Act non-hazardous waste based on waste profile analyses (i.e., a test performed at the direction of the generator and disposal facility to demonstrate the spent GAC is not a characteristic hazardous waste).

2.4 Problems Encountered with GWTS Operation

2.4.1 Subsurface

Table 8 lists Sites 2/12 GWE wells and provides a brief evaluation of each well's performance, operational status, problems identified during the reporting period, and recommendations for the next

[15] In accordance with the Groundwater QAPP (AEI, 2019e) decision rules or because of pump failures, not all GWE wells are sampled quarterly.

reporting period. Significant problems encountered and corrective actions implemented during the reporting period are described below.

- On July 7, 2019, a power outage caused a fault and loss of communications in EW-12-08-180U, and the well would not restart. The Sites 2/12 GWTP was turned offline on July 16, 2019, since EW-12-05-180M was the only operational GWE, and it could cause migration of the PCE groundwater plume away from the capture area. On July 22, 2019, EW-12-08-180U was repaired, and the Sites 2/12 GWTP was restarted.

2.4.2 Aboveground Treatment System

The operability of the Sites 2/12 GWTP during the reporting period was 72.9 percent (Table 3), which is below the 95 percent operational goal. Significant aboveground treatment system problems encountered and corrective actions implemented during the reporting period included:

- From October 12, 2018 through February 6, 2019, the Sites 2/12 GWTP was operated during business hours only to allow direct monitoring of GWTP operations because the SCADA system, which allowed for remote operations and sends alarms to the operator, was offline during the OU2 GWTP transition period.[16]
- On October 12, 2018, when the Sites 2/12 GWTP was shut down, GWE EW-12-05-180M did not shut down, which resulted in effluent tank TK-5480 (Figure 2) overflowing and filling the Sites 2/12 GWTP containment berm with treated water. On October 15, 2018, the treated water in the containment berm was pumped into the backwash tank and treated again through the Sites 2/12 GWTP prior to discharge at the Site 2 infiltration galleries.
- From March 5 to 12, 2019 the Sites 2/12 GWTP was offline intermittently due to PLC and communications issues. The PLC was reprogrammed to prevent future shutdowns; however, communications issues resulting from the OU2 GWTP transition period are expected to be resolved after the new OU2 GWTP is fully operational.[17]
- On March 15, 2019 the Sites 2/12 GWTP was shut down due to a leak in the effluent pipe. The leak was repaired and the system restarted on March 19, 2019.
- On March 22, 2019 the Sites 2/12 GWTP was offline due to communications issues at the OU2 GWTP.
- On March 26, 2019 the Sites 2/12 GWTP was offline due to power issues at the OU2 GWTP.
- From April 2 to 12, 2019 the Sites 2/12 GWTP shut down intermittently due to OU2 GWTP maintenance by the JV.
- From April 27 to May 7, 2019 the Sites 2/12 GWTP shut down intermittently due to OU2 GWTS communications issues.
- On May 13, 2019 the Sites 2/12 GWTP was offline for the repair of a broken effluent pipe air vacuum valve, which was replaced with a blind flange.
- On June 28, 2019 the Sites 2/12 GWTP was offline due to OU2 GWTS communications issues.

[16] The Sites 2/12 GWTP SCADA system is interconnected with the OU2 GWTP. Communications were re-established and the Sites 2/12 GWTP returned to full-time operations on February 7, 2019.
[17] The new OU2 GWTP is expected to be fully operational after the reporting period in early 2020.

2.5 System Modifications and Maintenance

2.5.1 Routine Maintenance

Routine maintenance activities were performed during the reporting period in accordance with the GWTS O&M Manual (AES, 2009).

2.5.2 System Modifications and Non-Routine Maintenance

There were no Sites 2/12 GWTS system modifications and no non-routine maintenance was performed during the reporting period.

2.6 Other Operations Information

No other Sites 2/12 GWTS operations information requires reporting for this period.

3.0 SVETS OPERATIONS SUMMARY

Operating performance of the Sites 2/12 SVETS is discussed below regarding extraction and treatment flow rates and totals, online effectiveness, non-routine operations, and indirect waste stream production. On February 11, 2019 the SVETS system was shut down for a rebound study due to low soil gas COC concentrations. The rebound study was conducted during the First Quarter and Second Quarter 2019 SGMP events, and the SVETS was not restarted during the reporting period. The SVTU process monitoring schedule is presented in Table 18. Flow rates and totals for the reporting period of system operation up to February 11, 2019 are presented in Table 19 and Figure 8. Treatment system operations were conducted following procedures in the SVETS O&M Manual (AEI, 2015c).

3.1 System Downtime

The Sites 2/12 SVTU was operational 36.3 percent of the time during the reporting period. Through January 2019, the Sites 2/12 SVTU was operational 99.8 percent of the time (Table 19), exceeding the operational goal of 95 percent. Downtime includes scheduled and unscheduled operational outages, including maintenance.

3.1.1 Routine

Sites 2/12 SVTU downtime associated with scheduled operational shutdowns from the start of the reporting period to February 11, 2019 was approximately 7.0 hours, and 5,566 hours during the entire reporting period. The following table summarizes routine events resulting in Sites 2/12 SVTU downtime during the reporting period.

Routine Events Resulting in System Downtime

Date	Routine Events	Duration (Hours)
11/13/2018	SVTU inspection and maintenance.[18] Sumps were empty.	1.0
12/13/2018	SVTU inspection and maintenance. Sumps were empty.	2.0
01/13/2019	SVTU inspection and maintenance. Sumps were empty.	2.0
01/21/2019	SVTU inspection and maintenance. Sumps emptied of 125 gallons of condensate.	2.0
02/11/2019-09/30/2019	SVTU shut down for rebound study on February 11, 2019 and remained offline through the end of the reporting period.	5,559.0
	Total Sites 2/12 SVTU Routine Downtime:	**5,566.0**

[18] Routine inspection and maintenance includes inspecting the following items and performing maintenance as needed: blower belts, oil levels, bearings, knockout tanks, sumps, SVTU structure, heat exchanger, plumbing connections, transfer pumps, hi-level switch, and GAC vessels.

3.1.2 Non-Routine

There was no Sites 2/12 SVTU downtime associated with non-routine operational shutdowns during the reporting period.

3.2 Operational Data and Process Monitoring Data

3.2.1 SVTU Influent and Effluent, and Efficiency of Aboveground Components

This section presents an evaluation of SVTU monitoring data and efficiency of aboveground treatment components during the reporting period. Chemical concentrations are monitored at up to three sampling locations on the SVTU. The sample station designations and descriptions are listed in the table below and shown in Figure 4.

Sample Station Designations and Descriptions

Station Designation	Description
SVTU-212-INF	Combined untreated influent soil gas from the online SVE wells for calculating total COC mass removal and monitoring treatment effectiveness.
SVTU-212-MID	Lead GAC vessel TK-2610A effluent for monitoring COC breakthrough to determine if a GAC change-out is required.
SVTU-212-EFF	Lag GAC vessel TK-2610B effluent for monitoring COC breakthrough to determine if a GAC change-out is required and discharge compliance.

The SVTU process monitoring sample dates and locations are presented in Table 18, and COC analytical data from the SVTU process samples are presented in Table 20. The SVTU process monitoring is conducted according to the schedule in the Soil Gas QAPP (AEI, 2019a). Analytical data generated during the reporting period were subjected to validation in accordance with the Soil Gas QAPP (AEI, 2019a) and were considered acceptable and suitable for use (Appendix E).

3.2.1.1 Flow Rates and Total Volume Treated

From the start of the reporting period until February 11, 2019, the SVTU operated continuously in the automatic control mode utilizing two GAC treatment vessels. The flow rate and treated volume data for the reporting period are summarized in Table 19. The total volume of treated soil gas for the reporting period was approximately 94 million standard cubic feet (scf). The average operational flow rate for the reporting period was 477 scf per minute (scfm). The average temporal flow rate for the reporting period was 199 scfm. The reported average monthly flow rate varies depending on flow rates for individual SVE wells and downtime events at the SVTU or SVE wells. Cumulative treated soil gas flow since startup on September 14, 2015 through September 30, 2019 was approximately 1.3 billion scf. Total system flow rates since system startup through February 11, 2019 are shown graphically in Figure 8.

3.2.1.2 Influent Monitoring

The combined Sites 2/12 SVTU influent is sampled at SVTU-212-INF prior to entering the liquid separators (Figure 4). Table 19 summarizes total influent COC concentrations (i.e., the sum of detected COC concentrations at the Sites 2/12 SVTU influent) during the reporting period, and specific influent

COC concentrations are presented in Table 20. A historical summary of influent COC concentrations is shown graphically in Figure 9. Both COCs (PCE and TCE) were detected in the SVTU influent during the reporting period, and the highest detected concentration of any COC at the influent was PCE at 26 µg/m^3 in November 2018 (this was the only SVTU influent sample collected during the reporting period). No COCs were detected above their SGCL or soil gas screening level (SG-SL) at the SVTU influent during the reporting period.

3.2.1.3 Discharge Compliance Monitoring

Discharge compliance monitoring is conducted as specified in the Soil Gas QAPP (AEI, 2019a) to document compliance with treated soil gas discharge requirements. Discharge compliance monitoring samples are collected at SVTU-212-EFF, as described above and shown in Figure 4. Analytical data for COCs are summarized in Table 20. TCE and PCE were detected at the discharge compliance monitoring point during the reporting period.

In accordance with the Soil Gas QAPP (AEI, 2019a), discharge limit compliance is achieved when the requirements of Monterey Bay Air Resources District Rule 207 (Air District, 2011) and Rule 1000 (Air District, 2017) are both met. Using the maximum detected total concentration of volatile organic compounds at the SVTU effluent (16 µg/m^3) and average operational flow rate during the reporting period (477 scfm), the discharge limit compliance was achieved, as evident by:

- Total volatile organic compound emissions were 0.00069 pounds per day (Table 21), which is less than the limit of 25 pounds per day under Rule 207.
- The hazard index was 0.00001 (Table 21), which is less than the maximum hazard index of 1 required under Rule 1000.
- Excess cancer risk to a hypothetical receptor 50 meters away from the SVTU discharge point was 7.5 x 10^{-9} (Table 21), which is less than the risk of 1 x 10^{-5} required under Rule 1000.

3.2.1.4 GAC Performance Monitoring

The Sites 2/12 SVTU was operated with both 3,000-pound GAC vessels online during the reporting period. During treatment, soil gas is extracted from the SVE wells and piped in series through the two GAC vessels (TK-2610A and TK-2610B) with TK-2610A in the lead position and TK-2610B in the lag position (Figure 4). The monitoring data are used to assess COC breakthrough and determine when GAC needs changing in the two vessels per the Soil Gas QAPP analytic approach (AEI, 2019a). During the reporting period, there was a breakthrough of TCE at the SVTU effluent in November 2018 (Table 20); however, discharge compliance was still achieved (see Section 3.2.1.3) and no additional action was required per the Soil Gas QAPP (AEI, 2019a).

3.2.1.5 SVETS Efficiency

SVETS efficiency is evaluated by comparing the PCE and TCE concentrations at the SVTU influent (SVTU-212-INF) to the post-GAC treatment effluent at the lag vessel effluent sample point (SVTU-212-EFF; Figure 4). SVETS COC removal efficiency for November 2018 was calculated at -176 percent for TCE

because the influent concentration was less than the effluent concentration.[19] SVETS COC removal efficiency for November 2018 was calculated at 100 percent for PCE (Table 20).

3.2.1.6 COC Mass Removed

The Sites 2/12 SVTU removed 0.18 of a pound of COCs during the reporting period and a cumulative 9.7 pounds since system startup on September 14, 2015 (Table 19 and Figure 10). PCE represented approximately 82 percent by weight of the total COCs in the untreated influent (SVTU-212-INF) during the reporting period, and the remaining 18 percent was TCE (Table 20).

3.2.2 SVE Well Data

SVE wells are typically monitored quarterly.[20] SVE well locations are shown in Figure 3. Operational runtime and total COC concentrations for individual SVE wells are reported in Table 22. A brief evaluation of individual SVE well performance during the reporting period and recommendations for the next reporting period are presented in Table 23.

Analytical data generated during this reporting period were subjected to validation as described in the Soil Gas QAPP (AEI, 2019a) and are considered acceptable and suitable for use. The VSRs for these analytical data are presented in Appendix E.

3.3 Consumables and Waste Handling/Disposal

3.3.1 Consumables Used

No GAC change-out events occurred during the reporting period.

3.3.2 Waste Handling/Disposal

Condensate water collected in SVE conveyance line sumps and SVTU liquid separators is transferred to the Sites 2/12 GWTP for treatment. No other waste handling or disposal was necessary during the reporting period as no GAC change-out events occurred.

3.4 Problems Encountered with SVETS Operation

3.4.1 Subsurface

Table 23 lists Sites 2/12 SVE wells and provides a brief evaluation of each well's performance, operational status, problems identified during the reporting period, and recommendations for the next reporting period. There were no significant subsurface SVETS problems, and corrective actions were not required during the reporting period.

[19] TCE removal efficiency has been negative since the Fourth Quarter 2017 due to TCE desorbing from the GAC as PCE continues to be adsorbed; however, a GAC change-out is not warranted because the SVETS remains in compliance with the substantive requirements of Air District Rules 207 and 1000 and continues to efficiently remove PCE, which is the only groundwater COC with concentrations above the ACL.

[20] In accordance with the Soil Gas QAPP (AEI, 2019a) decision rules or due to SVE well failures not all SVE wells are sampled quarterly.

3.4.2 Aboveground Treatment System

Through January 2019, overall operability of the SVTU was 99.8 percent (Table 19). There were no significant treatment system problems encountered during the reporting period.

3.5 System Modifications and Maintenance

3.5.1 Routine Maintenance

Routine maintenance activities were performed during the reporting period in accordance with the SVETS O&M Manual (AEI, 2015c). As described in Section 3.1.1, the SVTU was maintained through the reporting period with regular inspections and maintenance.

3.5.2 System Modifications and Non-Routine Maintenance

Non-routine maintenance was not performed during the reporting period. Below is a summary of operational changes made during the reporting period:

On February 11, 2019, the SVETS was turned off to perform a rebound study due to a decrease in COC concentrations to ND in SVE well VE-12-09 in the Third Quarter 2018 and Fourth Quarter 2018 SGMP events (AEI, 2019b). This modification was in accordance with Soil Gas QAPP analytic approach (AEI, 2019a and 2019c) and was agreed to by the regulatory agencies in February 2019 (Army, 2019a) because there was no apparent correlation between groundwater and soil gas PCE concentrations and no indication the SVETS was continuing to augment the groundwater remedy at Sites 2/12. The rebound study was conducted during the First Quarter and Second Quarter 2019 SGMP events (AEI, 2019d and 2019f), as discussed in Section 5.5.

3.6 Other Operations Information

During the reporting period, SVE well VE-12-09 was operated until February 11, 2019 to remediate soil gas and augment groundwater plume remediation. Table 22 lists the runtimes during the reporting period for individual SVE wells.

SVE wells were not operated during the Second Quarter and Third Quarter 2019 (Table 22) because the SVETS was shut down for a rebound study on February 11, 2019 with the concurrence of the regulatory agencies (Army, 2019a), which included monitoring for rebound in the First Quarter and Second Quarter 2019 SGMP events as discussed in Section 5.5.

No other Sites 2/12 SVETS operations information requires reporting for this period.

4.0 Subsurface Performance Summary — Groundwater

4.1 Sampling Events Performed During this Reporting Period

The Sites 2/12 GWMP events occurred as tabulated below.[21]

GWMP Events Schedule

Event Description	Start Date	End Date
Fourth Quarter 2018	December 11, 2018	December 19, 2018
First Quarter 2019	March 1, 2019	March 8, 2019
Second Quarter 2019	June 3, 2019	June 6, 2019
Third Quarter 2019	August 26, 2019	August 28, 2019

4.2 Sampling Methodologies and Laboratory Analyses

The majority of the groundwater samples were collected using passive diffusion bags (PDBs) at groundwater monitoring wells and GWE wells where the extraction pump was removed. Vertical placement of a PDB within the well screen is designed to capture the highest COC concentration zone of the aquifer based on historical data from the saturated screen interval. If the well has two or more high (or similar) COC concentration zones, then hanging multiple PDBs or periodically rotating a PDB between hanging stations is necessary.

PDBs are placed at a designated depth using PDB sampler hardware consisting of a dedicated rope and stainless steel weight secured to the top of the well casing or well cap. The PDB hardware rope is fitted with PDB hanging stations, usually at 5-foot intervals in the well screen zone. Depth to water measurements taken prior to sample collection ensures proper placement and complete groundwater submersion of the PDB, which is necessary for representative data collection. Once sampling is completed, a new PDB for the next quarterly GWMP event (if the well is sampled quarterly) is hung at the appropriate station. PDBs are typically left in place for three months (but must remain in place for at least two weeks) before sampling. Additionally, HydraSleeve™ sampling was conducted for chloride at select Sites 2/12 groundwater monitoring wells and GWE wells during the Third Quarter 2019 annual GWMP event.[22]

Aqueous sample collection at the Sites 2/12 GWTP monitoring points and active GWE wells use the designated sampling spigot. Offline GWE wells are turned online for several minutes prior to sampling to remove stagnant water from the pumping and sampling pipelines. Sampling standard operating procedures are located in the Groundwater QAPP (AEI, 2019e).

[21] The listed start and end dates are the scheduled event dates. Additional samples may be collected after the scheduled end date for technical reasons (see Section 5.3 and Table 10).

[22] Chloride is not identified as a COC for groundwater in the RI Sites ROD and therefore does not have an ACL. However, chloride is monitored to validate that groundwater near the GWTS at Sites 2/12 is not impacted by seawater intrusion during remediation.

SGS performed analyses for the Sites 2/12 groundwater monitoring samples. SGS is accredited through the Department of Defense (DoD) Environmental Laboratory Accreditation Program (ELAP). Groundwater samples are analyzed for a project-specific list of Sites 2/12 COCs (Table 1) by USEPA Laboratory Method 8260 SIM (selected ion monitoring). Also, during the annual GWMP event (Third Quarter 2019), chloride analysis was performed with USEPA Laboratory Method 9056A.

4.3 Deviations from the QAPP

The groundwater monitoring well sampling schedule is adjusted periodically to fill data gaps or reduce sampling frequency at locations that have historically low COC concentrations. These adjustments are made based on analyses of historical results at each sampling point and comparison to decision rules in the Groundwater QAPP (AEI, 2019e).

Modifications to the groundwater sample schedule during the reporting period are presented in Table 10. EW-12-06-180M was not sampled as scheduled after the Fourth Quarter 2017 due to a failed pump (Table 10).[23]

4.4 Well Maintenance

Field teams evaluated the physical integrity of each well during routine monitoring activities to ensure collection of representative samples, aquifer protection from potential exposure to surface contaminants, and safe access to the well by field technicians. Well maintenance notes and repairs are shown in Table 11.

4.5 Sampling Results and Interpretation

4.5.1 Water Levels

Depth to groundwater measurements were collected from 39 wells during the reporting period. Measurements and calculated groundwater elevations are presented in Table 12. Groundwater elevation contours for the Sites 2/12 Upper 180-Foot Aquifer West of the FO-SVA are presented in Figures 11 through 14. Groundwater elevations decreased by 0.90 of a foot on average since the Second Quarter 2019 (AEI, 2019f) and increased by 0.72 of a foot on average when compared to Third Quarter 2018 elevations (AEI, 2019c). The average groundwater elevation increased 2.7 feet since the Third Quarter 2013, which was the lowest groundwater elevation observed in the last seven years.

During the reporting period, groundwater elevations and flow directions in the unconfined Upper 180-Foot Aquifer were consistent with previous trends. The hydrographs presented in Figure 15 illustrate the variation in the Upper 180-Foot Aquifer groundwater elevations at Sites 2/12 and relative seasonal fluctuations at representative well locations from September 1997 through September 2019. Groundwater elevations decrease to the annual lowest elevation during the third quarter GWMP events (end of summer) and increase to the annual high elevation during the first quarter GWMP events (end of winter).

[23] As noted in Table 10, there are sufficient data from nearby wells, and the pump at EW-12-06-180M is not scheduled to be replaced.

Local and statewide drought conditions led to less than normal precipitation in water years 2012 through 2015 with recent water years 2016 through 2019 reaching normal and above-normal precipitation (except for water year 2018), as shown in the table below. California drought intensity was categorized as tabulated below during the same time span. Drought intensity peaked during the 2015 water year, with 46 percent of the state of California categorized as "D4: Exceptional Drought" conditions. Dramatic drought condition improvement was seen in the 2017 water year with 54 percent of the state of California with "None: No Drought" conditions. This drought improvement receded in the 2018 water year with 32 percent of the state of California in the "D0: Abnormally Dry" conditions, though in the 2019 water year 62 percent of the state of California was in "None: No Drought" conditions, which was the highest observed since 2013.

Local Precipitation and California Drought Conditions, Water Years 2012 through 2019

Water Year[24]	Percent of Average Precipitation in California Central Coast[25]	Percent Area Covered in California: Average Drought Intensity[26]					
		None: No Drought	D0: Abnormally Dry	D1: Moderate Drought	D2: Severe Drought	D3: Extreme Drought	D4: Exceptional Drought
2012	67	No Data					
2013	56	9	17	26	46	2	0
2014	47	1	1	5	33	36	23
2015	73	0	2	5	21	27	46
2016	90	1	8	16	20	23	32
2017	150	54	15	11	7	7	6
2018	59	35	32	20	11	2	0
2019	136	62	16	17	5	1	0

4.5.2 Groundwater COC Concentrations

The following summarizes the GWMP events during the reporting period.

- During the Fourth Quarter 2018, groundwater samples were collected at 19 Sites 2/12 well locations (AEI, 2019b). Analytical results for these samples are presented in Table 13, and PCE and TCE concentrations and COC contours at the ACL are shown in Figure 16.
- During the First Quarter 2019, groundwater samples were collected at 18 Sites 2/12 well locations (AEI, 2019d). Analytical results for these samples are presented in Table 14, and PCE and TCE concentrations and COC contours at the ACL are shown in Figure 17.

[24] Water Year: time period of 12 months between October 1 and September 30 for which precipitation totals are measured.
[25] Source: DWR, 2012 to 2019.
[26] Source: NIDIS, 2019.

- During the Second Quarter 2019, groundwater samples were collected at 18 Sites 2/12 well locations (AEI, 2019f). Analytical results for these samples are presented in Table 15, and PCE and TCE concentrations and COC contours at the ACL are shown in Figure 18.
- During the Third Quarter 2019, groundwater samples were collected at 23 Sites 2/12 well locations. Analytical results for these samples are presented in Table 16, and TCE concentrations and COC contours at the ACL are shown in Figure 19. Chloride analytical results from select Sites 2/12 wells are presented in Table 17.

Figure 20 shows historical and current PCE and TCE ACL exceedance contours in 2000 (TCE) and 2011 (PCE) and 2019 (PCE). A summary of groundwater analytical data during the reporting period is in Appendix A with the Third Quarter 2019 groundwater VSRs in Appendix B. Appendix C contains groundwater COC historical trend charts for select Sites 2/12 GWE wells and monitoring wells.

PCE was the only COC of the eight Sites 2/12 groundwater COCs that was detected at a concentration exceeding the ACL during the Third Quarter 2019. The remaining seven Sites 2/12 groundwater COCs (1,1-DCE; 1,2-DCA; total 1,3-DCP; chloroform; cis-1,2-DCE; TCE; and vinyl chloride) were detected at concentrations at or below their respective ACLs or were ND (Table 16). The maximum concentration of each COC in the Third Quarter 2019 is summarized in the table below.

Maximum Groundwater COC Concentrations for Sites 2/12 in the Third Quarter 2019

COC Name	Max Concentration (µg/L[27])		Locations Above ACL	Locations with Detections	Additional Comments
	Result	Location			
1,1-DCE	ND	N/A[28]	0	0%	No detections
1,2-DCA	0.20 J[29]	MW-12-16-180M	0	4%	South of Best Buy
total 1,3-DCP	ND	N/A	0	0%	No detections
Chloroform	0.21 J	MW-12-16-180M	0	22%	South of Best Buy
cis-1,2-DCE	1.9	MW-12-16-180M	0	35%	South of Best Buy
PCE	14.1	EW-12-08-180U	1	78%	East of Bed Bath & Beyond
TCE	2.4	MW-12-14-180M	0	52%	North of EW-12-05-180M
Vinyl chloride	ND	N/A	0	0%	No detections

PCE was the only COC of the eight Sites 2/12 groundwater COCs that was detected at concentrations exceeding the ACL during the reporting period. The remaining seven Sites 2/12 groundwater COCs (1,1-DCE; 1,2-DCA; total 1,3-DCP; chloroform; cis-1,2-DCE; TCE; and vinyl chloride) were detected at

[27] µg/L: micrograms per liter
[28] N/A: not applicable.
[29] J: laboratory or validation qualifier, estimated result between the detection limit and the limit of quantification with a possible high (+) or low (-) bias.

concentrations at or below their respective ACLs or were ND (Tables 13 through 16). The maximum concentration of each COC in the reporting period is summarized in the table below.

Maximum Groundwater COC Concentrations for Sites 2/12 during the Reporting Period (2018-4Q through 2019-3Q)

COC Name	Max Concentration (µg/L)		Quarter Identified	Additional Comments
	Result	Location		
1,1-DCE	ND	N/A	N/A	No detections
1,2-DCA	0.34 J	MW-12-16-180M	2019-1Q	South of Best Buy (Figure 17)
total 1,3-DCP	ND	N/A	N/A	No detections
Chloroform	0.43 J	MW-12-22-180U	2019-2Q	South of Famous Footwear (Figure 18)
cis-1,2-DCE	3.0	MW-12-16-180M	2019-1Q	South of Best Buy (Figure 17)
PCE	20 J-	MW-12-20-180U	2018-4Q	East of Michael's (Figure 16)
TCE	2.9	MW-12-09R-180	2019-1Q	South of EW-12-08-180U (Figure 17)
Vinyl chloride	ND	N/A	N/A	No detections

During the reporting period, the highest TCE concentration detected was at MW-12-09R-180 with a concentration of 2.9 µg/L in the First Quarter 2019. This monitoring well is located south of EW-12-08-180U. TCE was not detected at a concentration above the ACL during the reporting period.

During the reporting period, the highest PCE concentration detected was at MW-12-20-180U, with an estimated concentration of 20 µg/L in the Fourth Quarter 2018. This monitoring well is located north of EW-12-08-180U. PCE concentrations at MW-12-20-180U have declined since 2017 (maximum concentration of 45.5 µg/L) and were below the ACL in the Second Quarter and Third Quarter 2019 GWMP events (Appendix C, Figure C11A). The trend line for PCE concentrations at MW-12-20-180U is declining at a statistically significant rate (Appendix C, Figure C11B).

PCE was also detected at concentrations above the ACL at GWE well EW-12-08-180U, with a maximum concentration of 18.2 µg/L in the Fourth Quarter 2018. Detected concentrations of PCE at EW-12-08-180U have been above the ACL since operation of this GWE well began in 2015. PCE concentrations periodically increase at EW-12-08-180U as pumping from this well continues to remove PCE mass from the groundwater (Appendix C, Figure C5A). While the trend line for PCE concentrations at EW-12-08-180U is declining, it is not statistically significant due to variable concentrations since 2016 (Appendix C, Figure C5B).

COC concentrations have been declining at GWE well EW-12-05-180M since 2011 (Appendix C, Figure C2). This well is operated to increase the flow rate at the Sites 2/12 GWTP and to expand the capture area of GWE well EW-12-08-180U (see Section 4.6).

The extent of the PCE groundwater plume decreased in size during the reporting period (Figures 16 through 19).

The results of annual (Third Quarter 2019) analyses for chloride at six wells located at Sites 2/12 are summarized in Table 17. Chloride is not identified as a COC for groundwater in the RI Sites ROD and does not have an ACL. These results are used to determine if seawater intrusion is occurring during Sites 2/12 groundwater remediation activities and are compared to threshold values and typical seawater concentrations. Because treated water is pumped to the aquifer recharge structures at Site 2, seawater intrusion is not expected to be an issue at Sites 2/12 GWE and monitoring wells. The maximum inorganic analyte concentrations for the reporting period are summarized in the table below.

Maximum Groundwater Inorganic Analyte Concentrations for Sites 2/12 during the Reporting Period

Analyte Name	Concentration (mg/L[30])				Additional Comments
	Maximum Concentration		Threshold Value[31]	Typical Seawater	
	Result	Location			
Chloride	3,090	MW-02-13-180M	500	19,000	Site 2 area west of State Route 1

Maximum inorganic analyte concentrations during the reporting period show chloride concentrations above threshold values, but well below typical seawater concentrations. Chloride concentrations were below the threshold value at all monitored locations except MW-02-13-180M. Chloride concentrations were comparable with previous measurements (AEI, 2019c), except for MW-02-13-180M, where there was an approximately 40 percent decrease.

4.5.3 Data Validation and Quality Control Assessment

Five field duplicate samples were collected during the Third Quarter 2019 GWMP event at Sites 2/12. Trip blanks and field blanks were also collected during the GWMP event.[32,33] Trip blanks and field blanks were analyzed, and no target analytes were detected.

Results of data validation for the Third Quarter 2019 GWMP event and the Sites 2/12 GWTP sampling are provided in Appendix B. No GWMP or GWTP analytical results required additional qualification based on 100 percent Stage 2B and 10 percent Stage 4 data validation review. Thirty-one GWMP results were qualified as estimated (J) by SGS (Table 16) due to an estimated result between the detection limit and the limit of quantitation (LOQ).

The VSRs in Appendix B review data based on Groundwater QAPP guidelines (AEI, 2019e). All data are considered acceptable and suitable for use.

[30] mg/L: milligrams per liter

[31] The seawater intrusion front is defined as the inland extent at which the concentration of chloride in groundwater is at least 500 mg/L, which represents a level that is twice the National Secondary Drinking Water Regulation (250 mg/L) and which exceeds the concentration for water considered to be of "Class III - injurious or unsatisfactory" quality for agricultural irrigation (350 mg/L) (MCWRA, 2017).

[32] Trip blanks are laboratory provided sample bottles filled with analyte-free water that are not opened but travel with regular field samples.

[33] Field blanks are sample bottles filled with analyte-free water from an unused PDB during regular field sampling.

The laboratory assigns data qualifiers when analytical results are less than the laboratory limit of quantification or quality control measures are not met. Qualifiers included a "U," meaning the analyte was ND at or above the limit of detection (LOD) and a "J" meaning the analyte was detected at or above the detection limit but below the LOQ.

4.6 Groundwater Hydraulic Capture Evaluation

The basewide numerical groundwater flow model (the "model") used to simulate groundwater conditions beneath the former Fort Ord was updated in January 2016 (USACE-HEC, 2016) to evaluate hydraulic capture of COCs by the Upper 180-Foot Aquifer GWE wells at Sites 2/12. The model was updated in 2017 to include an extension of the model 400 feet vertically and 1000 feet horizontally to the south. The model was further updated in 2018 to include a "wave-cut terrace" conceptualization to assist in the simulation of observed sharp drops in water levels in the A-Aquifer. Additionally, the number of homogeneous hydraulic conductivity zones was reduced based on limited field data and the concept of appropriate complexity. The model simulates backward-tracking groundwater flow paths induced by operation of the Sites 2/12 GWE wells. The following sections summarize the background, data inputs, results, and calibration of the model.

4.6.1 Fort Ord Groundwater Model Background

The model is based on the finite-difference MODFLOW-2005 software (Harbaugh, 2005) originally completed for the Fort Ord basewide hydrogeological characterization and used in the Basewide RI/FS (HLA, 1995). Particle tracking was originally generated using the PATH3D model code (Zheng, 1989) and is currently generated using MODPATH (Pollock, 1994) in conjunction with MODFLOW-2005. Groundwater model construction, calibration, and capture zone analysis are performed using the Groundwater Vistas (ESI, 2011) software package, which works in conjunction with MODFLOW-2005 and MODPATH.

The model has been modified several times since its inception to incorporate changes to extraction or injection well configurations or results from additional groundwater investigations. In the past, each annual update to evaluate the GWTS is generally limited to updating average extraction and injection well flow rates. The current model update includes changes in A-Aquifer boundary conditions to reflect increased subsurface inflow and recharge resulting from a wetter than average water year during the reporting period.

4.6.2 Fort Ord Groundwater Model Data Inputs

The current model for Sites 2/12 accounts for average GWTS operating conditions reported from the Fourth Quarter 2018 through the Third Quarter 2019. Extraction and injection wells for the Sites 2/12 GWTS were simulated with average flow rate data reported from October 2018 through September 2019 and summarized in the following table.

Sites 2/12 GWTS Model Data Inputs

GWE Well	Average Flow[34] (gpm)	Status
EW-12-05-180M	90	Operational, sampled in GWMP
EW-12-06-180M	0	Offline due to low COC concentrations and pump failure, not sampled in GWMP
EW-12-07-180M	0	Offline due to low COC concentrations, sampled in GWMP
EW-12-08-180U	54	Operational, sampled in GWMP
EW-12-03-180U	0	Offline and no longer sampled due to low COC concentrations
EW-12-03-180M	0	Offline due to low COC concentrations, no pump, sampled in GWMP
EW-12-04-180U	0	Offline and no longer sampled due to low COC concentrations
EW-12-04-180M	0	Offline and no longer sampled due to low COC concentrations
Injection/ Infiltration Well	**Average Flow (gpm)**	**Status**
IW-02-01-180	0	Offline due to low injection capacity
IW-02-02-180	0	Offline due to low injection capacity
INF-02-01-180	155	Operational
INF-02-02-180	155	Operational
INF-02-03-180	155	Operational

4.6.3 Model Results

Groundwater capture was evaluated by comparing the simulated groundwater particle pathlines and associated capture zones to the aquifer areas requiring groundwater capture. Historically, the areas requiring groundwater capture include those portions of the aquifer where TCE concentrations exceeded the ACL of 5 µg/L; however, elevated concentrations of PCE at Sites 2/12 since 2011 have made areas where PCE is detected above its ACL (5 µg/L) the focus of capture by the GWTS, and EW-12-08-180U was installed in 2015 to target the PCE plume. Sites 2/12 TCE and PCE concentrations from the September 2019 sampling event were contoured and superimposed with the simulated backward-tracking particle pathlines reflecting October 2018 through September 2019 average pumping conditions for Sites 2/12 GWE wells in the Upper 180-Foot Aquifer (Figure 21). Each COC is contoured to the limit of its respective ACL. The encapsulation of the PCE plume by backward-tracking particle

[34] Temporal average.

pathlines emanating from Upper 180-Foot Aquifer Sites 2/12 GWE wells illustrates that the 2018 – 2019 extraction and injection configuration was able to provide successful capture conditions.

The particle travel time of the pathlines illustrated in Figure 21 is 15 years. A soil porosity value of 0.20, which is common for medium sands, was used in the model to simulate transport in the unconfined Upper 180-Foot Aquifer. When compared to the particle pathlines simulated in the 2018 study, it is notable that much of the water drawn from the GWE wells originates not only from the south but also from the ocean to the west. This is largely the result of observed water levels in 2019 being 0.55 to 1.08 feet higher than in 2018. The accurate calibration to these water levels required the raising of boundary conditions along the oceanfront. Thus, reverse particle zone simulations resulted in the capture zones being formed in areas both immediately to the south and the ocean front, where higher water levels were simulated.

4.6.4 Fort Ord Groundwater Calibration

Calibration of any model includes the comparison of simulated conditions to observed conditions. In this case, the model is calibrated to observed groundwater elevations at monitoring wells located throughout the Sites 2/12 area. Poor calibration results usually indicate that simulated conditions (e.g., boundary conditions, pumping rates, or aquifer parameters) are not consistent with actual conditions and usually require modification of input data until calibration results improve.

Groundwater elevation data collected from Sites 2/12 monitoring wells were used as calibration targets for the model. Water levels were averaged from four quarterly measurements taken between October 2018 and September 2019. Average extraction and injection well flow rates over the same period were also input into the model. The goal of the calibration process is to replicate field conditions of water levels and groundwater flow. A water level residual is defined as:

Residual = Simulated Value - Measured Value

Water level residuals are measured in units of feet. The closer the residual is to zero, the better the fit at a given target location. Calibration to water levels was performed manually in an effort to minimize the mean and absolute water level residuals. The residual statistics were evaluated by traditional statistics, and graphical presentation of the observed target heads versus the model predicted heads. Calculated errors (residuals) were statistically evaluated by calculating the mean error, absolute mean error, and the root mean square error or standard deviation (Anderson and Woessner, 1992). In this case, residuals inevitably result from the simulation of average conditions (e.g., pumping rate, recharge rates) instead of transient rates that may reflect observed seasonal changes in groundwater elevation data.

Model calibration statistics (as summarized in the following table) are within the range reported for previous annual reporting periods and indicate that the model is acceptably calibrated (ASTM International, 2008) for the capture analysis for Sites 2/12.

Model Calibration Statistics

Calibration Statistic	Sites 2/12 Upper 180-Foot Aquifer
Mean Error (feet)	0.08
Mean Absolute Error (feet)	0.44
Root Mean Squared Error (square feet)	0.54

Linear plots of simulated versus observed groundwater elevation for each monitoring point are illustrated in Figure 22. A perfectly calibrated model would result in data plotting directly along the 45-degree line. As shown in Figure 22, residuals for the unconfined Upper 180-Foot Aquifer generally plotted along the 45-degree line, and the sign and magnitude of residuals are randomly distributed within the model domain with relatively few outliers, as is desired for an acceptably calibrated model.

As with all numeric modeling exercises, limitations, and uncertainties in model input directly affect the model results. Model predictions (including the predicted particle pathlines used to evaluate capture herein), therefore, have the same uncertainties and limitations as the numeric model. Uncertainties in model input parameters include hydraulic conductivities, porosity, recharge, model water balance, or model boundary conditions. Uncertainty is also introduced by the simulated steady-state model conditions, which necessarily vary from transient conditions such as seasonal precipitation or pumping rates and associated groundwater elevation changes.

5.0 Subsurface Performance Summary — Soil Gas

5.1 Sampling Events Performed During this Reporting Period

The Sites 2/12 soil gas monitoring events occurred as tabulated below.

SGMP — Events Schedule

Event	Start Date	End Date
Fourth Quarter 2018	November 13, 2018	November 14, 2018
First Quarter 2019	February 25, 2019	February 27, 2019
Second Quarter 2019	May 20, 2019	May 22, 2019
Third Quarter 2019	August 19, 2019	August 21, 2019

5.2 Sampling Methodologies and Laboratory Analyses

Soil gas sampling was conducted using SUMMA canisters evacuated to subatmospheric pressure. A SUMMA canister was attached to the soil gas probe via a sample manifold used for soil gas probe purging and sampling. The sampling apparatus was covered with a plastic shroud, which is filled with approximately 30 percent helium (by volume) to field test for leaks in the sampling train. The SGMP analytical schedule is shown in Table 24.

Eurofins Air Toxics in Folsom, California, performed analyses for the Sites 2/12 SGMP samples. Eurofins Air Toxics is accredited through the DoD ELAP. In accordance with the Soil Gas QAPP (AEI, 2019a), soil gas samples are analyzed for a project-specific list of Sites 2/12 COCs (Table 2) by USEPA Method TO-15.

5.3 Deviations from the QAPP

Periodically, the soil gas sampling schedule is adjusted to fill data gaps or reduce sampling frequency at locations that have historically low COC concentrations. These adjustments are made based on analyses of historical results at each sampling point and comparison to the analytic approach in the Soil Gas QAPP (AEI, 2019a).

The SVTU influent and effluent were not sampled as scheduled in the Soil Gas QAPP because the SVETS was shut down on February 11, 2019 for a rebound study.

Modifications to the soil gas sampling schedule during the reporting period are presented in Table 25. Modifications included collecting samples from four soil gas probes and two SVE wells, which had previously been removed from SGMP, in the First Quarter and Second Quarter 2019 SGMP events for the rebound study. During the reporting period, SG-12-06-70 was not sampled because the screen was determined to be submerged based on groundwater elevations observed in nearby wells. In lieu of SG-12-06-70, the vertically adjacent soil gas probe SG-12-06-50 was sampled instead. The nearby groundwater elevation will continue to be monitored quarterly to determine whether the groundwater elevation declines below the SG-12-06-70 screen interval.

5.4 Probe Maintenance

Field teams evaluated the physical integrity of each soil gas probe and SVE well during routine monitoring activities to ensure collection of representative samples, protection of the subsurface from potential exposure to surface contaminants, and safe access to the soil gas probe or SVE well by field technicians. There were no soil gas probe or SVE well maintenance issues identified during the reporting period.

5.5 Sampling Results and Interpretation

5.5.1 Soil Gas COC Concentrations

The following summarizes the SGMP events during the reporting period.

- During the Fourth Quarter 2018, soil gas samples were collected at six Sites 2/12 soil gas probes and one SVE well (AEI, 2019b). Analytical results for these samples are presented in Table 26, and TCE and PCE concentrations are shown in Figure 23.
- During the First Quarter 2019, soil gas samples were collected at nine Sites 2/12 soil gas probes and two SVE wells (AEI, 2019d). Analytical results for these samples are presented in Table 26, and TCE and PCE concentrations are shown in Figure 24.
- During the Second Quarter 2019, soil gas samples were collected at nine Sites 2/12 soil gas probes and two SVE wells (AEI, 2019f). Analytical results for these samples are presented in Table 26, and TCE and PCE concentrations are shown in Figure 25.
- During the Third Quarter 2019, soil gas samples were collected at 16 Sites 2/12 soil gas probes. No soil gas samples were collected at SVE wells. Analytical results for these samples are presented in Table 26, and TCE and PCE concentrations are shown in Figure 26.

Figure 27 shows historical and current soil gas COC exceedance contours for June 2014 and September 2019 at the 70-foot soil gas probes and SVE wells.[35] A summary of soil gas analytical data during the reporting period is in Appendix D with the Third Quarter 2019 soil gas VSRs in Appendix E. Appendix F contains soil gas COC historical trend charts for select Sites 2/12 SVE wells and soil gas probes.

Soil gas COCs TCE and PCE were not detected above their respective SGCLs during the reporting period and TCE was not detected above the SG-SL during the reporting period. Two soil gas probe clusters at SG-12-02 and SG-12-20 had concentrations of PCE above the SG-SL but below the SGCL (Table 26).

The maximum concentrations of each COC in the Third Quarter 2019 and during the reporting period are summarized in the following tables.

Maximum Soil Gas COC Concentrations for Sites 2/12 in the Third Quarter 2019

COC Name	Max Concentration (µg/m³)		Locations Above		Additional Comments
	Result	Location	SGCL	SG-SL	
PCE	1,300	SG-12-02-10	0	7	Adjacent to Target entrance

[35] There was no September 2019 soil gas COC exceedance contour for the soil gas probes and SVE wells (i.e., no detected COC concentrations exceeded SGCLs).

COC Name	Max Concentration (µg/m³)		Locations Above		Additional Comments
	Result	Location	SGCL	SG-SL	
TCE	640	SG-12-17-40	0	0	Northeast of Cinemark

Maximum Soil Gas COC Concentrations for Sites 2/12 during the Reporting Period

COC Name	Max Concentration (µg/m³)		Quarter Identified	Additional Comments
	Result	Location		
PCE	1,400	SG-12-02-10	2018-4Q	Adjacent to Target entrance (Figures 23 and 26)
TCE	640	SG-12-17-40	2019-3Q	Located northeast of Cinemark (Figure 26)

There were no detections of PCE or TCE in soil gas above the SGCL during the reporting period. Additional information about historical results above the SGCL are presented below:

- The last detection of PCE above the SGCL at Sites 2/12 was in the Fourth Quarter 2015 at soil gas probe SG-12-06-30 (Appendix F, Figure F6). Historical PCE concentrations for the soil gas probes in the SG-12-06 cluster have been declining since monitoring began in 2013 and decreased at a greater rate since SVETS operations began in September 2015. After the SVETS was shut down in February 2019, there was no significant rebound observed, with PCE concentrations well below the SGCL and SG-SL (Appendix F, Figure F6).
- The last detection of TCE above the SGCL at Sites 2/12 was in the First Quarter 2017 at the soil gas probe SG-12-17-40 (Appendix F, Figure F8). Historical TCE concentrations for the soil gas probe SG-12-17-40 declined since full-scale SVETS operations began in September 2015 and have had minimal rebound since the southern SVE wells were taken offline in September 2017 (Appendix F, Figure F8).
- The last detection of TCE above the SGCL in the northern part of the site was in the Second Quarter 2015 SGMP event at the SG-12-04 uppermost 10-foot and 20-foot probes (Appendix F, Figure F5B). TCE concentrations declined below the SGCL after SVETS operations began. After the SVETS was shut down in February 2019, there was no significant rebound observed, with PCE concentrations still below the SGCL and SG-SL (Appendix F, Figure F5B).

Soil gas probe cluster SG-12-02, located adjacent to Target (Figure 3), also had a decline in PCE concentrations in most of the probes (Appendix F, Figure F4). Declining PCE concentrations were observed at SG-12-02-10, the uppermost probe at this location, after SVETS operations began in September 2015. Since the Second Quarter 2016, PCE concentrations at SG-12-02-10 have remained between the SG-SL and the SGCL with an overall decreasing trend. PCE concentrations at this soil gas probe do not follow the same concentration trends as other soil gas probe clusters because it is located adjacent to a stormwater infiltration basin, which may truncate the radius of influence of the northern SVE wells in this area. Therefore, there was no expected nor observed rebound at SG-12-02 following shut down of the SVETS in February 2019.

Soil gas probe cluster SG-12-20 is located in the center east of the parking lot (Figure 3) and had PCE concentrations above the SG-SL during the reporting period at the uppermost 10-foot and 20-foot probes, which are comparable to previous monitoring events (Appendix F, Figure F9). This soil gas probe is located outside the radius of influence of SVE well VE-12-09; therefore, there was no expected nor observed rebound at SG-12-20 after the SVETS was shut down in February 2019.

Significant decreases in PCE concentrations were observed in several soil gas probe clusters upon startup of the SVE system in September 2015. These soil gas probe clusters include:

- SG-12-01 (Appendix F, Figure F3) located in the Michaels parking lot and east of the storefront, where concentrations remain below the SG-SL and exhibited minimal rebound after the SVETS was shut down in February 2019.
- SG-12-04 (Appendix F, Figure F5A) located adjacent to Michaels retail building storefront on the east side, where concentrations remain below the SG-SL and exhibited minimal rebound after the SVETS was shut down in February 2019.
- SG-12-06 (Appendix F, Figure F6) located adjacent to Bed Bath & Beyond retail building storefront on the east side, where concentrations remain below the SG-SL and exhibited minimal rebound after the SVETS was shut down in February 2019.

There was a significant rate of decline in PCE concentrations in the northern SVE wells after startup of the SVETS in September 2015 and minimal rebound after the SVETS was shut down in February 2019 as described above.

The one operating northern SVE well VE-12-09 was taken offline on February 11, 2019 for the rebound study to be conducted in the First Quarter and Second Quarter 2019 SGMP events. PCE and TCE in sampled soil gas probes and SVE wells had no or minimal increases in COC concentrations during the rebound study and remained below the SG-SL. Based on these results, the SVETS remained offline as agreed to by the regulatory agencies in July 2019 (Army, 2019b).

5.5.2 Data Validation and Quality Control Assessment

Two field duplicate samples were collected during the Third Quarter 2019 SGMP event at Sites 2/12. Results of data validation for the Third Quarter 2019 SGMP event are provided in Appendix E. No SGMP analytical results required additional qualification based on 100 percent Stage 2B and 10 percent Stage 4 data validation review. Four SGMP results were qualified as estimated (J) by Eurofins (Table 26) due to estimated results between the detection limit and the LOQ. The VSR in Appendix E reviews data based on Soil Gas QAPP guidelines (AEI, 2019a). All data are considered acceptable and suitable for use.

The laboratory assigns data qualifiers when analytical results are less than the laboratory limit of quantification or quality control measures are not met. Qualifiers include a “U,” meaning the analyte was ND at or above the LOD, and a “J” meaning the analyte was detected at or above the detection limit, but below the LOQ.

6.0 Interpretation of Progress Toward System Goals

As described in the RI Sites ROD (Army, 1997), the goals of the Sites 2/12 groundwater remedy are to protect human health and comply with Federal and State law by returning groundwater to a condition that will allow beneficial use, including potential future use as a drinking water source. These goals are accomplished through hydraulic control and containment of contaminated groundwater, through extraction and treatment of groundwater exceeding ACLs, and through recharge of the aquifer to maintain a groundwater mound to minimize saltwater intrusion at Site 2. Remediation of Sites 2/12 groundwater is somewhat complicated by the partitioning of COCs between soil gas and groundwater; however, the removal of COCs in soil gas through operation of the SVETS contributes to resolving this complication.

6.1 Progress with Respect to Short-Term Goals

Based on comparisons of the observed COC distribution to hydraulic capture areas simulated using the updated groundwater capture model (see Section 4.6), the current GWE well configuration maintains PCE groundwater plume capture. The operation of northern SVE wells may have also augmented remediation of the PCE groundwater plume through the removal of COCs partitioning from groundwater to soil gas up until the SVETS was shut down in February 2019 for the soil gas rebound study.

A short-term goal for Sites 2/12 is the closure of the soil gas remedial unit. This goal includes attainment monitoring to evaluate whether concentrations of soil gas COCs remain below the SGCLs. All soil gas probes were below the COC SGCLs during the reporting period. Concentrations of PCE and TCE were less than their respective SG-SLs and SGCLs in the SVE wells monitored during the rebound study in the First Quarter and Second Quarter 2019 (Appendix F, Figures F1 and F2). No SVE wells were sampled in the Third Quarter 2019 after the rebound study was completed (Table 26).

The northern PCE soil gas concentrations are consistently below the SGCL. There are two soil gas probes (SG-12-02 and SG-12-20) with PCE concentrations consistently above the SG-SL, but these concentrations are decreasing (SG-12-02) or stable (SG-12-20), and are not within the capture area of an SVE well (Appendix F, Figures F4 and F9).

The one operating SVE well (VE-12-09) was taken offline during the reporting period due to a decrease in PCE concentrations in both groundwater and soil gas. Since February 11, 2019, SVE wells have remained offline for the rebound study and through the remainder of the reporting period. After the SVETS was turned off, there was an increase in PCE and TCE soil gas concentrations observed at the three northern soil gas probe locations (SG-12-01, SG-12-04, and SG-12-06), which are within the radius of influence for SVE well VE-12-09. However, soil gas COC concentrations still do not exceed SG-SLs or SGCLs (Appendix F, Figures F3, F5A, F5B, and F6) and SG-12-01, SG-12-04, and SG-12-06 are not within the PCE groundwater plume extent, indicating there is no significant partitioning of COCs from groundwater to soil gas. Two northern soil gas probes (SG-12-01-65 and SG-12-04-65) will continue to be monitored quarterly for potential rebound in the northern area.[36]

6.2 Progress with Respect to Long-Term Goals

The long-term goal is the closure of the Sites 2/12 groundwater remedial unit. This goal includes attainment monitoring to evaluate whether concentrations of groundwater COCs will remain below ACLs.

Progress toward achieving long-term goals is being accomplished through continued operation of the GWTS and collection of data through the GWMP, which supports the implementation of decision rules for GWTS operations and modification of the GWMP. It was estimated the long-term goal would be achieved three years after implementation of the SVETS (AES, 2015) or approximately by 2018. To this end, the COC mass in the groundwater was reduced significantly during the reporting period as described in Section 4.5.2, and was defined by only one or two wells with PCE concentrations above the ACL. Groundwater monitoring well MW-12-20-180U had variable PCE concentrations historically and an overall declining trend during the reporting period, with two detections above the ACL followed by two detections below the ACL (Appendix C, Figure C11A). GWE EW-12-08-180U has had consistent PCE concentrations an order of magnitude above the ACL, indicating it is effective at removing the remaining mass of PCE above the ACL in the area (Appendix C, Figure C5A).

Mann-Kendall statistical analysis was performed for analytical data from both MW-12-20-180U and EW-12-08-180U (USEPA, 2016). With MW-12-20-180U PCE data from First Quarter 2017 through Third Quarter 2019 (eleven data points),[37] the Mann-Kendall analysis showed a statistically significant decreasing trend with an S value of -31 with 95 percent confidence (Appendix C, Figure C11B). The Mann-Kendall statistical analysis for PCE at EW-12-08-180U, since well installation in the Third Quarter 2015 through the Third Quarter 2019 (18 data points), showed a decreasing trend with an S value of -41. However, the trend was not statistically significant at the 95 percent confidence level due to variability in the data (Appendix C, Figure C5B). MW-12-20-180U will continue to be sampled quarterly, and EW-12-08-180U will continue to be operated and sampled quarterly to monitor for remedial progress.

[36] The third northern soil gas probe (SG-12-06-70) is proposed for removal from the SGMP (see Section 7.4 and Appendix H).

[37] Use of the complete historical dataset for MW-12-20-180U (starting in Fourth Quarter 2013) resulted in no statistically significant PCE concentration trend; therefore, a recent subset of data was used for statistical analysis.

In addition to Mann-Kendall statistical analysis for analytical data from MW-12-20-180U and EW-12-08-180U, pore volume calculations were performed for EW-12-08-180U and the current extent of the PCE plume in groundwater at the site to determine a remediation time to reach the ACL and RAOs (Appendix I). The pore volume calculations with an increased pumping rate of 90 gpm in EW-12-08-180U indicate the RAOs and the ACL for PCE will be met in approximately 2 years (2022).

6.3 Gaps or Inconsistencies in the Conceptual Site Model

There are no identified gaps or inconsistencies in the conceptual site model.

7.0 SUGGESTED SYSTEM MODIFICATIONS

7.1 GWTS Modifications

The Sites 2/12 GWTS has been in operation since April 1999 (over 20 years as of the date of this report). Normal wear and tear and exposure to local environmental conditions degrade the GWTS facilities. An increasing rate of component failure is expected, as indicated by the GAC vessel underdrain malfunction (AEI, 2019c).

Ongoing changes to GWTS equipment and operational parameters occur as part of the GWTS optimization process and development of related exit strategies. Significant progress has been made in remediating the Sites 2/12 groundwater COC plumes. However, PCE mass remains in groundwater in the vicinity of EW-12-08-180U. Based on this evaluation, the following system modifications are recommended to improve performance, reduce costs, and increase the likelihood of achieving cleanup goals:

- Continue operating the Sites 2/12 GWTS, including optimization of flow rates to maximize COC mass removal and groundwater plume capture.
- Develop a Sites 2/12 exit strategy in preparation for site closure.
- Implement recommendations for individual GWE wells listed in Table 8.
- Replace the Site 2 infiltration galleries control valves and controllers to prevent stripping of valve stems and optimize distribution to the infiltration galleries of increased treated water flow from the OU2 GWTP.[38]

7.2 GWMP Modifications

GWMP modifications are made by comparing analytical results to Groundwater QAPP decision rules (AEI, 2019e). GWMP modifications during the reporting period are discussed in Section 4.3 and listed in Table 10. The recommended modifications to the GWMP after the Third Quarter 2019 GWMP event are listed in Table 27 and Appendix G. Wells recommended for termination of sampling will continue to be monitored for groundwater elevation data until they are recommended for decommissioning.

7.2.1 New Wells

No new groundwater monitoring or GWE wells were installed during the reporting period, and no new wells are recommended.

7.2.2 Well Decommissioning

Fourteen Sites 2/12 groundwater wells are no longer sampled as part of the GWMP and are only monitored for quarterly groundwater elevations. Six of these wells are no longer needed for groundwater elevation measurements; therefore, decommissioning of these wells (EW-12-03-180U, EW-12-04-180U, MW-02-13-180U, MW-12-08-180, MW-12-12-180L, and MW-12-19-180U) is recommended (Figure 28). No groundwater monitoring wells were decommissioned during the reporting period.

[38] Work was completed after the reporting period in March 2020.

7.3 SVE System Modifications

The southern SVE area rebound study was conducted during the First Quarter 2019 (AEI, 2019d) and Second Quarter 2019 (AEI, 2019f). Based on the soil gas analytical results for SG-12-16 and SG-12-17 (Table 26), which indicate COC concentrations remain below their SG-SLs, it is recommended the southern SVE wells remain offline. Based on the soil gas analytical results for SG-12-01, SG-12-04, and SG-12-06 (Table 26), which indicate COC concentrations remain below their SG-SLs, it is recommended the northern SVE wells remain offline. PCE and TCE were mostly ND in SVE wells VE-12-06 and VE-12-09, except for an estimated detection of PCE in VE-12-09 in the Second Quarter 2019 (Table 26). Though VE-12-09 is within the PCE groundwater plume footprint, the future operation of this SVE well should be evaluated quarterly based on results from nearby soil gas probes SG-12-01 and SG-12-04. Operation of the SVETS should be evaluated to determine whether it continues to augment groundwater remediation with a more comprehensive rebound study that includes both groundwater and soil gas data in 2020.

After reviewing the rebound study data from the 2020 quarterly monitoring events, the long-term operational status of the SVETS may be determined. Therefore, there are no recommended modifications to the SVETS after the Third Quarter 2019 SGMP event. Soil gas data will continue to be evaluated quarterly during the rebound study, and the SVETS can be restarted as needed per the analytic approach in the Soil Gas QAPP (AEI, 2019a).

7.4 SGMP Modifications

SGMP modifications are made by comparing analytical results to Soil Gas QAPP analytic approach (AEI, 2019a). SGMP modifications during the reporting period are discussed in Section 5.3. The recommended modifications to the SGMP after the Third Quarter 2019 SGMP event (changes effective in the Fourth Quarter 2019 SGMP event) are listed in Table 28 and Appendix H and were accepted by the regulatory agencies (Army, 2019c).

7.4.1 New Probes or SVE Wells

No new soil gas probes or SVE wells were installed during the reporting period, and no new probes nor SVE wells are recommended at this time.

7.4.2 Probe or SVE Well Decommissioning

Fifteen soil gas probe clusters and ten SVE wells have been removed from the SGMP program. Five soil gas probe clusters and eight SVE wells are not recommended for decommissioning at this time due to rebound study analysis proposed for 2020. Ten soil gas probe clusters (SG-12-03, SG-12-05, SG-12-09, SG-12-11, SG-12-12, SG-12-13, SG-12-15, SG-12-22, SG-12-23, and SG-12-24) and two SVE wells (VE-12-04 and VE-12-05) are recommended for decommissioning in accordance with the Soil Gas QAPP analytic approach (AEI, 2019a) as shown on Figure 29. All the soil gas probes in each cluster recommended for decommissioning met the Soil Gas QAPP analytic approach to be removed from the sampling program, and the clusters are no longer needed for the SGMP. The two SVE wells are recommended for decommissioning because they are no longer needed for soil gas or groundwater plume remediation per the Soil Gas QAPP analytic approach.

No probes or SVE wells were decommissioned during the reporting period.

Average:	72.9%	4,273,377	98		8.3	0.27	
Total:		51,280,524		2,099,318,283		3.2	488

Notes:

[1] Volume calculated as the sum of volumes from the Sites 2/12 groundwater extraction wells.

[2] Since system startup in April 1999.

[3] Total COC influent concentration, sampled based on granular activated carbon (GAC) change-out cycle and Groundwater Quality Assurance Project Plan (Groundwater QAPP) sampling schedule.

[4] COC mass removed from the aquifer by operating extraction wells.

Acronyms and Abbreviations:

µg/L: micrograms per liter
COC: chemical of concern
gpm: gallons per minute
GWTP: groundwater treatment plant
NS: not sampled

Table 5. Summary of Groundwater Treatment Plant Analytical Results

Notes:
Results in **bold** are concentrations above the Aquifer Cleanup Level (ACL)
Results in gray are not detected concentrations (reported as <limit of detection [LOD])
#: number
* Last GAC change out was on 6/6/2017 and 6/4/2019; the average GAC cycle at the Sites 2/12 GWTP is approximately 90 weeks
^Duplicate sample

Acronyms and Abbreviations:
µg/L: micrograms per liter
COC: chemical of concern
GAC: granular activated carbon
QAPP: Quality Assurance Project Plan
Qual: qualifier

Analyte Names:
1,1-DCE: 1,1-dichloroethene
1,2-DCA: 1,2-dichloroethane
cis-1,2-DCE: cis-1,2-dichloroethene
PCE: tetrachloroethene
TCE: trichloroethene
total 1,3-DCP: total 1,3-dichloropropene

Station Descriptions:
TS-212-EFF: air stripper effluent
TS-212-GAC-A: GAC Vessel A effluent
TS-212-INF: influent sample location
TS-212-INJ: injection point of compliance sample location

Data Validation Qualifiers:
A: validation qualifier, no additional qualification required
J: laboratory or validation qualifier, estimated result between the detection limit (DL) and the limit of quantification (LOQ) with a possible high (+) or low (-) bias
U: laboratory or validation qualifier, concentration not detected (reported as <LOD)

Table 6. GWTP Influent/Effluent TCE Concentrations and Efficiency

Last GAC change-outs occurred on: 6/6/2017 & 6/4/2019

Month-Year	Influent Concentration (µg/L)	GAC Vessel Effluent Concentration[1] (µg/L)	GAC Efficiency[2] (percent)	Air Stripper Effluent Concentration (µg/L)	Air Stripper Efficiency (percent)	GWTP Efficiency[2] (percent)	Discharge Concentration[3] (µg/L)

Notes:

Results in **bold** are concentrations above the Aquifer Cleanup Level (ACL).

Results in gray are not detected concentrations below the limit of detection (LOD).

[1] Sample collected at GAC Vessel A effluent (see Figure 2).

[2] Efficiency calculated using the detection limit when an analyte is not detected.

[3] Sample collected at TS-212-INJ, the injection point of compliance (see Figure 2).

[4] See Table 5 for laboratory and data validation qualifiers.

Acronyms and Abbreviations:

µg/L: micrograms per liter

GAC: granular activated carbon

GWTP: groundwater treatment plant

NC: not calculated; efficiencies cannot be calculated when the location is not sampled.

NS: not sampled per Groundwater Quality Assurance Project Plan (QAPP) sampling schedule and GAC change-out cycle.

PCE: tetrachloroethene

TCE: trichloroethene

Table 6. GWTP Influent/Effluent PCE Concentrations and Efficiency

Month-Year	Influent Concentration (µg/L)	GAC Vessel Effluent Concentration[1] (µg/L)	GAC Efficiency[2] (percent)	Air Stripper Effluent Concentration (µg/L)	Air Stripper Efficiency (percent)	GWTP Efficiency[2] (percent)	Discharge Concentration[3] (µg/L)

Notes:

[1] Extraction well offline due to low COC concentrations per QAPP decision rules

[2] Removed from the groundwater monitoring program due to low COC concentrations per QAPP decision rules

[3] Pump failure in March 2018, no sample collected after pump failure

Acronyms and Abbreviations:

µg/L: micrograms per liter
COC: chemical of concern
EW: extraction well
gpm: gallons per minute
NS: not sampled (see Groundwater QAPP for well sample schedule)
ND: not detected (all COCs were ND)
QAPP: Quality Assurance Project Plan

Table 8. Groundwater Extraction Well Historical Data, Evaluation, and Recommendations

Extraction Well	2018-19 Runtime	Flow Rates (gpm)				Total COCs (µg/L)				Evaluation	Recommendations
		Design	Historic Maximum	Historic Average	2018-19 Average	Historic Maximum	Historic Minimum	2018-19 Average	Trend		
EW-12-03-180U	0%	25	289	5.0	0	142	0.12	NS	N/A	Not operated during the reporting period due to low COC concentrations (pump removed, converted to MW). COC concentrations below ACLs since 2006. Removed from GWMP in 2015.	Continue non-operation and monitor groundwater elevations per the Groundwater QAPP.
EW-12-03-180M	0%	50	187	26	0	277	ND	2.7	Steady	Not operated during the reporting period due to low COC concentrations (pump removed, converted to MW). COC concentrations below ACLs since 2012.	Continue non-operation and sample quarterly per the Groundwater QAPP.
EW-12-04-180U	0%	50	161	9.0	0	28	0.38	NS	N/A	Not operated during the reporting period due to low COC concentrations (pump removed, converted to MW). COC concentrations below ACLs since 2007. Removed from GWMP in 2016.	Continue non-operation and monitor groundwater elevations per the Groundwater QAPP.
EW-12-04-180M	0%	75	333	17	0	143	0.22	NS	N/A	Not operated during the reporting period due to low COC concentrations (pump removed, converted to MW). COC concentrations below ACLs since 2004. Removed from GWMP in 2013.	Continue non-operation and monitor groundwater elevations per the Groundwater QAPP.
EW-12-05-180M	72%	71	486	60	90	53	3.4	3.8	Steady	PCE concentrations below ACL since 2015-4Q and continue to decline. TCE concentrations below ACL since 2013 and continued to decline; however, TCE concentrations below ACL in adjacent MW-12-14-180M since 2018.	Continue operation for capture of the PCE plume and sample quarterly per the Groundwater QAPP. Install a VFD to optimize flow regulation.
EW-12-06-180M	0%	75	200	71	0	257	2.4	NS	N/A	Not operated during the reporting period due to low COC concentrations. COC concentrations below ACLs since 2013. Not sampled after 2017-4Q due to a failed pump.	Continue non-operation, plume captured by other EWs. Sample collection from this well unnecessary due to data available from nearby wells.
EW-12-07-180M	0%	78	528	32	0	19	0.51	3.0	Down	Not operated during the reporting period due to low COC concentrations. TCE below ACL since 2012.	Continue non-operation and sample quarterly per the Groundwater QAPP.
EW-12-08-180U	70%	60	62	62	43	31	11	16	Steady	PCE concentrations above ACL and TCE concentrations below ACL since operation began in 2015-3Q.	Continue operation for capture of PCE plume and sample quarterly per the Groundwater QAPP.

Acronyms and Abbreviations:

2018-19: October 1, 2018 through September 30, 2019
%: percent
µg/L: micrograms per liter
ACL: Aquifer Cleanup Level
COC: chemical of concern
EW: extraction well
gpm: gallons per minute
GWMP: groundwater monitoring program
GWTP: groundwater treatment plant
MW: monitoring well
N/A: not applicable
ND: not detected (all COCs were ND)
NS: not sampled
PCE: Tetrachloroethene
QAPP: Quality Assurance Project Plan
TCE: Trichloroethene
VFD: variable frequency drive

VOCs: volatile organic compounds

Table 10. Groundwater Sampling Schedule Modifications, Fourth Quarter 2018 through Third Quarter 2019

Well Name	Previous Status	New Status	Mechanical/ Well Failure	Rationale / Notes / Corrections	Last Sampling Event/s	Last DTW Event
GWMP Schedule Modifications Based on Groundwater QAPP Decision Rules						
MW-12-26-180U	Q	A	N/A	Met QAPP decision rules to reduce sampling frequency to annual	Ongoing	Ongoing
Mechanical, Well, or Sampling Issues						
EW-12-06-180M	Q	N/A	Pump failure in March 2018	Nearby wells provide sufficient groundwater COC and DTW data, pump will not be replaced	2017-4Q	Ongoing

Acronyms and Abbreviations:

A: annual

D: depth to water only (no sampling)

DTW: depth to water

GWMP: groundwater monitoring program

N/A: not applicable

Q: quarterly

QAPP: quality assurance project plan

Table 11. Groundwater Well Maintenance

Well ID	Quarter Identified	Condition/Repair Comments	Sample Frequency	Maintenance Notes	Date Maintenance Completed
MW-02-06-180	2016-2Q	One tab is stripped and one tab is broken. Needs new well cap.	DTW Only	New 4-inch well cap installed. Welding required to repair tabs.	
MW-12-05-180	2016-4Q	Drum lid covers plastic well box, not secure. Sand in well box, need to add PVC casing to increase well height.	Annual (chloride only)	Investigating options to secure well.	
MW-12-07-180	2016-4Q	PVC casing extension is loose.	DTW Only		
MW-12-15-180M	2016-4Q	Needs new bolts and retap threads.	Quarterly		
MW-12-16-180M	2017-3Q	One bolt is stripped.	Quarterly		
MW-12-20-180U	2017-3Q	Strong diesel odor noted while sampling.	Quarterly	Investigated total petroluem hydrocarbon in surrounding wells and MW-12-20-180 during the 2017-2018 reporting period and determined no further action necessary. Odor was no longer observed, no sheen observed. Odor was observed again in the 2019-3Q event.	2018-2Q
MW-12-23-180U	2016-4Q	One bolt is stripped.	DTW Only		

Acronyms and Abbreviations:
DTW: depth to water
Q: quarter

Notes:

-: not measured: total depth only measured in annual third quarter event.

[1] Elevations are given in feet relative to mean sea level (MSL).

[2] Depth to water and total depth is measured from top of well casing. Wells with pumps unable to measure total depth.

[3] EW-12-06-180M pump failure, unable to collect depth to water during all events.

Table 13. Summary of Groundwater Monitoring Analytical Results, Fourth Quarter 2018

Notes:

--: sample collected from an extraction well spigot, therefore no sample depth is given.

* Duplicate sample

Results in **bold** are concentrations above the Aquifer Cleanup Level (ACL).

Results in gray are not detected concentrations (result reported as <limit of detection [LOD]).

Analyte Names:

1,1-DCE: 1,1-dichloroethene

1,2-DCA: 1,2-dichloroethane

cis-1,2-DCE: cis-1,2-dichloroethene

PCE: tetrachloroethene

TCE: trichloroethene

total 1,3-DCP: total 1,3-dichloropropene

Acronyms and Abbreviations:

µg/L: micrograms per liter

ft btoc: feet below top of casing

Qual: qualifier

Data Validation Qualifiers:

J: Laboratory qualifier, estimated result between the detection limit (DL) and the limit of quantification (LOQ) with a possible high (+) or low (-) bias.

U: Laboratory or validation qualifier, concentration not detected (reported as <LOD).

UJ: Validation qualifier, The analyte was analyzed for, but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

Qual: qualifier

Data Validation Qualifiers:

J: Laboratory qualifier, estimated result between the detection limit (DL) and the limit of quantification (LOQ) with a possible high (+) or low (-) bias.

U: Laboratory or validation qualifier, concentration not detected (reported as <LOD).

UJ: Validation qualifier, The analyte was analyzed for, but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

Table 16. Summary of Groundwater Monitoring Analytical Results, Third Quarter 2019

Notes:

--: sample collected from an extraction well spigot, therefore no sample depth is given.

* Duplicate sample

Results in **bold** are concentrations above the Aquifer Cleanup Level (ACL).

Results in gray are not detected concentrations (result reported as <limit of detection [LOD]).

Analyte Names:

1,1-DCE: 1,1-dichloroethene

1,2-DCA: 1,2-dichloroethane

cis-1,2-DCE: cis-1,2-dichloroethene

PCE: tetrachloroethene

TCE: trichloroethene

total 1,3-DCP: total 1,3-dichloropropene

Acronyms and Abbreviations:

µg/L: micrograms per liter

ft btoc: feet below top of casing

PDB: passive diffusion bag

Qual: qualifier

Data Validation Qualifiers:

J: Laboratory qualifier, estimated result between the detection limit (DL) and the limit of quantification (LOQ) with a possible high (+) or low (-) bias.

U: Laboratory or validation qualifier, concentration not detected (reported as <LOD).

UJ: Validation qualifier, The analyte was analyzed for, but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

Table 17. Summary of Chloride Analytical Results, Third Quarter 2019

Station	Depth (ft btoc)	PDB Bag	Analyte:	Chloride (as Cl)	
			Units:	mg/L	
			Seawater Value:	19,000	
			Threshold Value:	500

Average:	26		ND		100%	5.8		16		-176%
Maximum:	26		ND			5.8		16		
Percent of Total:	82%		0			18%		100%		

Notes:

Results in gray are not detected (result reported as <limit of detection [LOD]), LOD value used for efficiency calculation. TCE removal efficiency has been negative since the Fourth Quarter 2017 due to TCE desorbing from the GAC as PCE continues to be adsorbed; however, a GAC change-out is not warranted because the SVETS remains in compliance with the substantive requirements of Air District Rules 207 and 1000 and continues to efficiently remove PCE, which is the only groundwater COC with concentrations above the ACL.

Acronyms and Abbreviations:

µg/m^3: micrograms per cubic meter
NC: not calculated
NS: not sampled
PCE: tetrachloroethene
Qual: qualifier
SVTU: soil vapor treatment unit
TCE: trichloroethene

Data Validation Qualifiers:

A: Validation qualifier, no additional qualification required
J: Laboratory or validation qualifier, estimated result between the detection limit (DL) and the limit of quantification (LOQ) with a possible high (+) or low (-) bias.
U: laboratory or validation qualifier, concentration not detected.

Table 21. SVTU Discharge Compliance Calculations

Rule 207 Emissions Calculation (limit is 25 lb/day) [1]			
Maximum SVTU Effluent Total VOCs	Average Flow Rate	Total VOC Emissions	Total VOC Emissions
µg/m^3	cfm	lbs/hour	lbs/day
16	477	0.00003	0.00069

SVTU Influent Concentrations and Ratios

Removed: Soil gas sample was removed from the soil gas monitoring program and is not sampled per QAPP decision criteria

Table 25. Soil Gas Sampling Schedule Modifications, Fourth Quarter 2018 through Third Quarter 2019

Soil Gas Probe ID	Previous Status	New Status	Rationale / Notes / Corrections	Last Sampling Event
SGMP Schedule Modifications Based on Soil Gas QAPP Decision Rules				
SG-12-01-58	Removed	N/A	Sampled in the 2019-1Q and 2019-2Q events for a soil gas rebound study after the SVTU was turned offline in February 2019. QAPP frequency not changed.	2019-2Q
SG-12-04-58	Removed	N/A	Sampled in the 2019-1Q and 2019-2Q events for a soil gas rebound study after the SVTU was turned offline in February 2019. QAPP frequency not changed.	2019-2Q
SG-12-06-60	Removed	N/A	Sampled in the 2019-1Q and 2019-2Q events for a soil gas rebound study after the SVTU was turned offline in February 2019. QAPP frequency not changed.	2019-2Q
SG-12-06-70	Annual	N/A	Sampled in 2018-4Q in leiu of 2018-3Q due to increasing groundwater elevation and probe submerged in 2018-3Q. Probe sampled in the 2019-2Q event for a soil gas rebound study after the SVTU was turned offline in February 2019. QAPP frequency not changed.	Ongoing
VE-12-06	Removed	N/A	Sampled offline extraction well in the 2019-1Q and 2019-2Q events for a soil gas rebound study after the SVTU was turned offline in February 2019. QAPP frequency not changed.	2019-2Q
VE-12-09	Removed	N/A	Sampled offline extraction well in the 2019-1Q and 2019-2Q events for a soil gas rebound study after the SVTU was turned offline in February 2019. QAPP frequency not changed.	2019-2Q
SGMP Schedule Modifications Based on Soil Gas Probe Issues				
SG-12-06-50	Removed	N/A	Sampled in 2019-2Q in lieu of SG-12-06-70, which was submerged due to increasing groundwater elevations.	2019-2Q
SG-12-06-70	Annual	N/A	Unable to sample 2019-2Q due to increasing groundwater elevation. SG-12-06-50 sampled in lieu of this probe.	Ongoing

Acronyms and Abbreviations:

Annual: sampled on the third quarter event (once per year) QAPP: Quality Assurance Project Plan

Removed: Soil gas sample was removed from the soil gas monitoring program and is not sampled per QAPP decision criteria

SVTU: soil vapor treatment unit

Table 26. Summary of Soil Gas Monitoring
Analytical Results, Fourth Quarter 2018 through Third Quarter 2019

	05/22/19	64	J	<40	U
Maximum:		*1,400*		640	

Acronyms and Abbreviations:

µg/m³: micrograms per cubic meter
PCE: tetrachloroethene
Qual: qualifier
SVE: soil vapor extraction
TCE: trichloroethene

Notes:

* Duplicate sample, results only for quality control purposes and not used to determine maximum concentration.

Results in *italics* are concentrations above the Soil Gas Screening Level (SG-SL) but below the Soil Gas Cleanup Level (SGCL).

TCE SG-SL= 888 µg/m3; PCE SG-SL= 603 µg/m3. TCE SGCL= 1,000 µg/m3; PCE SGCL= 1,800 µg/m3

Results in gray are not detected concentrations (reported as <limit of detection [LOD]).

Data Validation Qualifiers:

U: Laboratory or validation qualifier, result not detected at or above the LOD (identified by <LOD)

Table 27. Recommended Groundwater Sample Schedule Modifications

Well Name	Current Sampling Frequency	Recommended Sampling Frequency Change	Rationale
MW-02-05-180	Annual (VOC and chloride)	Stop Sampling	Meets QAPP decision rules to stop sampling[1]
MW-12-05-180	Annual (chloride)	Stop Sampling	Meets QAPP decision rules to stop sampling
MW-12-18-180U	Annual (VOC)	Stop Sampling	Meets QAPP decision rules to stop sampling
MW-12-25-180U	Annual (VOC)	Stop Sampling	Meets QAPP decision rules to stop sampling

Notes:

[1] If two consecutive annual monitoring results show concentrations of COCs below their respective LOQs, or below 10% of their respective ACLs, whichever is greater, then the well may be proposed to be removed from the sampling program. These changes are presented in Appendix G with maps and COC concentration trend charts.

Acronyms and Abbreviations:

ACL: Aquifer Cleanup Level

Annual: sampled in the third quarter event (once per year)

COC: chemical of concern

LOQ: limit of quantitation

Stop Sampling: no longer sampled for COCs; however, will continue to be monitored for groundwater elevation quarterly until the well is decommissioned.

VOC: volatile organic compound

Table 28. Recommended Soil Gas Sample Schedule Modifications

Soil Gas Probe ID	Current Sampling Frequency	Recommended Sampling Frequency Change	Rationale
SGMP Schedule Modifications Based on Soil Gas QAPP Decision Rules			
SG-12-06-70	Annual	Remove	Met QAPP decision rules to stop sampling, which was confirmed during the rebound study conducted 2019-1Q and 2019-2Q.
SG-12-16-60	Annual	Remove	Met QAPP decision rules to stop sampling, which was confirmed during the rebound study conducted 2019-1Q and 2019-2Q.

Acronyms and Abbreviations:

Annual: sampled in the third quarter event (once per year)

QAPP: Quality Assurance Project Plan

Remove: not sampled

NOTES:

(1) Samples were collected between June 3, and June 6, 2019.

(2) Contours are based on one interpretation of the data that were available at the time this report was prepared; other interpretations may be possible.

(3) Contours based on highest value obtained from multiple bags where applicable.

(4) Other COC ACL exceedances detected beyond the extent of the PCE plume are illustrated when present.

Notes:
--: Sample collected with pump spigot
Acronyms and Abbreviations:
µg/L: micrograms per liter
mg/L: milligrams per liter
Qual: qualifier
NS: normal sample
FD: Field Duplicate
ND: Non Detect
WG: Water
Data Validation Qualifiers:
J: Laboratory qualifier, estimated result between the detection limit (DL) and the limit of quantification (LOQ) with a possible high (+) or low (-) bias.
U: Laboratory or validation qualifier, concentration not detected (reported as <LOD).
UJ: Validation qualifier, The analyte was analyzed for, but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

SUBJECT: Fort Ord, GWTP OU2, Data Validation

Dear Mr. Schmidt,

Enclosed are the final validation reports for the fractions listed below. These SDGs were received on September 20, 2019. Attachment 1 is a summary of the samples that were reviewed for each analysis.

LDC Project #45997:

SDG #	Fraction
FA65781, FA66715, FA67546, FA67557 FA67558, FA67560, FA67613, FA67615 FA67649, FA67650, FA67651, FA67652 FA67657, FA67700, FA67702, FA67715 FA67745, FA67763, FA67764, FA67761	Volatiles, Metals, Chloride

The data validation was performed under Stage 2B & 4 guidelines. The analyses were validated using the following documents, as applicable to each method:

- Final Quality Assurance Project Plan Volume I, Appendix A for Groundwater Remedies and Monitoring at Operable Unit 2, Sites 2 and 12, and Operable Unit Carbon Tetrachloride Plume, Former Fort Ord, California; Revision 7, August 2019
- U.S. Department of Defense Quality Systems Manual for Environmental Laboratories, Version 5.1; 2017
- USACE Guidance for Evaluating Performance-Based Chemical Data; June 2005
- EPA SW 846, Third Edition, Test Methods for Evaluating Solid Waste, update 1, July 1992; update IIA, August 1993; update II, September 1994; update IIB, January 1995; update III, December 1996; update IIIA, April 1998; IIIB, November 2004; update IV, February 2007; update V, July 2014

Please feel free to contact us if you have any questions.

Sincerely,

Pei Geng
Pgeng@lab-data.com
Project Manager/Senior Chemist

INTRODUCTION

This Data Validation Report (DVR) presents Stage 2B and 4 data validation results for samples collected during the July through September 2019 sampling period. Data validation was performed in accordance with the Final Quality Assurance Project Plan Volume I, Appendix A for Groundwater Remedies and Monitoring at Operable Unit 2, Sites 2 and 12, and Operable Unit Carbon Tetrachloride Plume, Former Fort Ord, California (Revision 7, August 2019), the U.S. Department of Defense (DoD) Quality Systems Manual (QSM) for Environmental Laboratories, Version 5.1 (2017), and the USACE Guidance for Evaluating Performance-Based Chemical Data (June 2005). Where specific guidance is not available, the data has been evaluated in a conservative manner consistent with industry standards using professional experience.

The analyses were performed by the following method:

Volatiles (VOCs) by Environmental Protection Agency (EPA) SW 846 Method 8260B in Selection Ion Monitoring (SIM) mode
Dissolved Metals by EPA SW846 Method 6010C
Chloride by EPA Method 300.0/SW 846 Method 9056A

The sample identification and method of analyses performed on each sample is presented in Attachment 1. Overall data qualification summary is presented in Attachment 2. Stage 2B Automated Data Review outliers are presented in Enclosure I. DVRs for samples on which Stage 4 validation was performed are presented in Enclosure II.

All sample results were subjected to Stage 2B data validation, which comprises an evaluation of quality control (QC) summary results for sample holding times, initial and continuing calibrations, initial and continuing calibration blanks (ICB/CCBs), surrogates, internal standards, matrix spike/matrix spike duplicates (MS/MSD), laboratory control sample (LCS), laboratory blanks, trip blanks, equipment blanks, field blanks, and field duplicates. Approximately 10 percent of samples were subjected to Stage 4 evaluation as indicated in Attachment 1, which comprises a review of the QC summary forms as well as the raw data, to confirm sample quantitation and identification.

Automated data review was performed on all QC summary results using the Automated Data Review (ADR) software program (LDC, 2013) with the exception of the calibrations, ICB/CCBs, and internal standards, which were validated manually. Quality assurance (QA)/QC criteria specified in the QAPP and EM-200-1-10 were incorporated with the program's reference library to assess compliance with project requirements.

The following are definitions of the data qualifiers utilized during data validation:

J+ (Estimated, High Bias): The compound or analyte was analyzed for and positively identified by the laboratory; however the reported concentration is estimated, displaying high bias, due to non-conformances discovered during data validation.

J- (Estimated, Low Bias): The compound or analyte was analyzed for and positively identified by the laboratory; however the reported concentration is estimated, displaying low bias, due to non-conformances discovered during data validation.

J (Estimated, Bias Indeterminate): The compound or analyte was analyzed for and positively identified by the laboratory; however the reported concentration is estimated due to non-conformances discovered during data validation. Bias is indeterminate.

U (Non-detected): The compound or analyte was analyzed for and positively identified by the laboratory; however the analyte should be considered non-detect at the reported concentration due to the presence of contaminants detected in the associated blank(s).

UJ (Non-detected estimated): The compound or analyte was reported as not detected by the laboratory; however the reported quantitation/detection limit is estimated due to non-conformances discovered during data validation.

R (Rejected): The sample results were rejected due to gross non-conformances discovered during data validation. Data qualified as rejected is not usable.

NA (Not applicable): The non-conformance discovered during data validation demonstrates a high bias, while the affected compound or analyte in the associated sample(s) was reported as not detected by the laboratory and did not warrant the qualification of the data.

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

I. Sample Receipt & Technical Holding Times

All samples were received in good condition and cooler temperatures upon receipt met validation criteria.

All technical holding time requirements were met.

II. Instrument Performance Check

Instrument performance was checked at the frequency required by the methods.

All criteria for the instrument performance check were met.

III. Initial Calibration and Initial Calibration Verification

All criteria for the initial calibration and initial calibration verifications of each method were met.

IV. Continuing Calibration

All criteria for the continuing calibration verifications of each method were met with the following exceptions:

SDG/ Method	Date	Compound	%D (Limits)	Associated Samples	Flag	A or P
FA67700/ 8260B-SIM	09/09/19	Methylene chloride	21 (≤20)	1935X0BW087F 1935X0BW088D 1935X0BW089F	NA	-
FA67715/ 8260B-SIM	09/09/19	Methylene chloride	21 (≤20)	1935XOU2070C 1935XOU2071A 1935YOU2057F 1935YOU2058F 1935YOU2059F	NA	-

V. Laboratory Blanks

Laboratory blanks were performed as required by the methods. No contaminant concentrations were detected in the laboratory blanks reviewed by the ADR software program with the exception of several blanks for methylene chloride and one blank for antimony. The associated sample results were qualified as non-detected (U) due to laboratory blank contamination as applicable. The sample results that were not detected or were significantly greater than the concentrations found in the associated blanks were not qualified. The details regarding the qualification of data are provided in Enclosures I and II.

No contaminant concentrations were detected in the initial or continuing calibration blanks with the following exceptions:

SDG/ Method	Laboratory Blank ID	Analyte	Maximum Concentration	Associated Samples
FA67649/ 6010C	ICB/CCB	Antimony	2.80 ug/L	1935YOU2032F 1935YOU2034F
FA67649/ 6010C	ICB/CCB	Antimony	3.10 ug/L	1935YOU2036F 1935YOU2037F 1935YOU2038D
FA67764/ 300.0/9056A	ICB/CCB	Chloride	0.880 mg/L	1936Y212086F 1936Y212087D 1936Y212088F

Sample concentrations were compared to concentrations detected in the laboratory blanks. The sample concentrations were not detected or were significantly greater than the concentrations found in the associated blanks with the following exceptions:

SDG/Method	Sample	Compound	Reported Concentration	Modified Final Concentration
FA67649/ 6010C	1935YOU2032F	Antimony	1.5 ug/L	1.5U ug/L
FA67649/ 6010C	1935YOU2034F	Antimony	3.8 ug/L	3.8U ug/L
FA67649/ 6010C	1935YOU2036F	Antimony	1.8 ug/L	1.8U ug/L
FA67649/ 6010C	1935YOU2037F	Antimony	2.4 ug/L	2.4U ug/L
FA67649/ 6010C	1935YOU2038D	Antimony	1.7 ug/L	1.7U ug/L

VI. Field Blanks

Twenty-two trip blanks were collected and analyzed for VOCs. No contaminants were found.

One equipment blank was collected and analyzed for VOCs. No contaminants were found.

Seven field blanks were collected and analyzed for VOCs. No contaminants were found.

VII. Surrogates

Surrogates were added to all samples as required by the method. All surrogate recoveries (%R) were within QC limits with the exception of five samples for VOCs. The associated sample results were qualified as non-detected estimated (UJ). No data were qualified due to high %Rs when the associated results were non-detected. The details regarding qualification of data are presented in Enclosures I and II.

VIII. Matrix Spike/Matrix Spike Duplicates

Matrix spike (MS) and matrix spike duplicate (MSD) sample analysis was performed on an associated project sample. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits with the exception of two MS/MSD pairs for methylene chloride and one MS/MSD pair for chloride. No data were qualified due to high %Rs since the associated results were non-detected or the sample concentration was significantly greater (>4x) than the spiked amount. The details are provided in Enclosure I.

IX. Duplicate Sample Analysis

Duplicate (DUP) sample analysis was performed on an associated project sample. Results were within QC limits.

X. Laboratory Control Samples

Laboratory control samples (LCS) and laboratory control sample duplicates (LCSD) were analyzed as required by the method. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

XI. Field Duplicates

Twenty-five field duplicate pairs were collected and analyzed for VOCs or metals. All RPDs were within QC limits with the exception of two duplicate pairs for VOCs and one duplicate pair for metals. No data were qualified on the basis of field duplicate RPDs outside the QC limits. The field duplicate result comparisons are provided in Enclosures I and II.

XII. Internal Standards

All internal standard areas and retention times were within QC limits.

XIII. Compound Quantitation

The laboratory reporting limits were evaluated. All laboratory reporting limits met the specified requirements.

All compounds reported below the limit of quantitation (LOQ) as detected by the laboratory were qualified as detected estimated (J). The details regarding the qualification of data are provided in Enclosures I and II.

XIV. Overall Assessment of Data

The analysis was conducted within all specifications of the method. No results were rejected in these SDGs.

Due to surrogate %R, data were qualified as estimated one sample.

Due to results below the LOQ, data were qualified as estimated in one hundred sixty-nine samples.

Due to laboratory blank contamination, data were qualified as not detected in five samples.

The quality control criteria reviewed, other than those discussed above, were met and are considered acceptable.

Data flags are summarized and are presented as Attachment 2.

VALIDATION COMPLETENESS WORKSHEET

~~ADR~~/~~Stage~~ 4

Stage 4

Date: 10/2/19

Reviewer: 9

2nd Reviewer: 12C

METHOD: GC/MS Volatiles (EPA SW 846 Method 8260B-SIM)

The samples listed below were reviewed for each of the following validation areas. Validation findings are noted in attached validation findings worksheets.

	Validation Area		Comments
I.	Sample receipt/Technical holding times	A	
II.	GC/MS Instrument performance check	A	
III.	Initial calibration/ICV	A/A	~~RSD~~ ≤ 15%. r^2 ICV ≤ 20%
IV.	Continuing calibration / Ending	A	CCV ≤ 20/50%
V.	Laboratory Blanks	N	Not reviewed for ADR validation.
VI.	Field blanks		TB=5
VII.	Surrogate spikes		Not reviewed for ADR validation.
VIII.	Matrix spike/Matrix spike duplicates		Not reviewed for ADR validation.
IX.	Laboratory control samples		Not reviewed for ADR validation.
X.	Field duplicates		D = 7, 8, 20, 21
XI.	Internal standards	A	Not reviewed for ADR validation.
XII.	Compound quantitation RL/LOQ/LODs	N	Not reviewed for ADR validation.
XIII.	Target compound identification		Not reviewed for ADR validation.
XIV.	System performance		Not reviewed for ADR validation.
XV.	Overall assessment of data		Not reviewed for ADR validation.

Note: A = Acceptable; N = Not provided/applicable; SW = See worksheet; ND = No compounds detected; R = Rinsate; FB = Field blank; D = Duplicate; TB = Trip blank; EB = Equipment blank; SB=Source blank; OTHER:

(ADR) ~~Stage 4~~

Date: 10/4/19

Page: 1 of 1

Reviewer: KK

2nd Reviewer:

METHOD: Dissolved Metals (EPA SW 846 Method 6010C)

The samples listed below were reviewed for each of the following validation areas. Validation findings are noted in attached validation findings worksheets.

	Validation Area		Comments
I.	Sample receipt/Technical holding times	A /N	
II.	Instrument Calibration	A	
III.	ICP Interference Check Sample (ICS) Analysis	A	
IV.	Laboratory Blanks	SW	ICB/CCB only
V.	Field Blanks	N	
VI.	Matrix Spike/Matrix Spike Duplicates		Not reviewed for ADR validation.
VII.	Duplicate sample analysis		
VIII.	Serial Dilution		Not reviewed for ADR validation.
IX.	Laboratory control samples		Not reviewed for ADR validation.
X.	Field Duplicates		Not reviewed for ADR validation. (4,5)
XI.	Sample Result Verification		Not reviewed for ADR validation.
XII.	Overall Assessment of Data	✓	

Note: A = Acceptable; N = Not provided/applicable; SW = See worksheet; ND = No compounds detected; R = Rinsate; FB = Field blank; D = Duplicate; TB = Trip blank; EB = Equipment blank; SB=Source blank; OTHER:

VALIDATION FINDINGS WORKSHEET
PB/ICB/CCB QUALIFIED SAMPLES

Reviewer: KK
2nd Reviewer:

METHOD: Trace metals (EPA SW 864 Method 6010C)
Soil preparation factor applied:

Sample Concentration units, unless otherwise noted: ug/L Associated Samples: 1, 2

					Sample Identification										
Analyte	**Maximum PB (mg/kg)**	**Maximum PB (ug/L)**	**Maximum ICB/CCB (ug/L)**	**Action Level**	1	2									
Sb			2.80	14	1.5	3.8									

Sample Concentration units, unless otherwise noted: ug/L Associated Samples: 3-5

					Sample Identification										
Analyte	**Maximum PB (mg/kg)**	**Maximum PB (ug/L)**	**Maximum ICB/CCB (ug/L)**	**Action Level**	3	4	5								
Sb			3.10	15.5	1.8	2.4	1.7								

Samples with analyte concentrations within five times the associated ICB, CCB or PB concentration are listed above with the identifications from the Validation Completeness Worksheet. These sample results were qualified as not detected, "U".
Note : a - The listed analyte concentration is the highest ICB, CCB, or PB detected in the analysis of each element.

METHOD: GC/MS VOA (EPA SW 846 Method 8260B)

Please see qualifications below for all questions answered "N". Not applicable questions are identified as "N/A".

(Y) N N/A — Was a continuing calibration standard analyzed at least once every 12 hours for each instrument?
Y (N) N/A — Were percent differences (%D) and relative response factors (RRF) within method criteria for all CCC's and SPCC's ?
Y (N) N/A — Were all %D and RRFs within the validation criteria of ≤20 %D and ≥0.05 RRF ?

VALIDATION FINDINGS WORKSHEET
Continuing Calibration

Reviewer: 9
2nd Reviewer: RLR

METHOD: GC/MS VOA (EPA SW 846 Method 8260B)

Please see qualifications below for all questions answered "N". Not applicable questions are identified as "N/A".

Y N N/A Was a continuing calibration standard analyzed at least once every 12 hours for each instrument?
Y N N/A Were percent differences (%D) and relative response factors (RRF) within method criteria for all CCC's and SPCC's ?
Y N N/A Were all %D and RRFs within the validation criteria of ≤20 %D and ≥0.05 RRF ?

#	Date	Standard ID	Compound	Finding %D (Limit: ≤20.0%)	Finding RRF (Limit: ≥0.05)	Associated Samples	Qualifications

Introduction

This Data Validation Report (DVR) presents data validation findings and results for the associated samples listed on the cover page. Data validation was performed in accordance with the Final Quality Assurance Project Plan Volume I, Appendix A for Groundwater Remedies and Monitoring at Operable Unit 2, Sites 2 and 12, and Operable Unit Carbon Tetrachloride Plume, Former Fort Ord, California (Revision 7, August 2019), the U.S. Department of Defense (DoD) Quality Systems Manual (QSM) for Environmental Laboratories, Version 5.1 (2017), and the USACE Guidance for Evaluating Performance-Based Chemical Data (June 2005). Where specific guidance was not available, the data has been evaluated in a conservative manner consistent with industry standards using professional experience.

The analyses were performed by the following method:

Volatile Organic Compounds (VOCs) by Environmental Protection Agency (EPA) SW 846 Method 8260B in Selected Ion Monitoring (SIM) mode

All sample results were subjected to Stage 4 data validation, which is comprised of the quality control (QC) summary forms as well as the raw data, to confirm sample quantitation and identification.

The following are definitions of the data qualifiers utilized during data validation:

J+ (Estimated, High Bias): The compound or analyte was analyzed for and positively identified by the laboratory; however the reported concentration is estimated, displaying high bias, due to non-conformances discovered during data validation.

J- (Estimated, Low Bias): The compound or analyte was analyzed for and positively identified by the laboratory; however the reported concentration is estimated, displaying low bias, due to non-conformances discovered during data validation.

J (Estimated, Bias Indeterminate): The compound or analyte was analyzed for and positively identified by the laboratory; however the reported concentration is estimated due to non-conformances discovered during data validation. Bias is indeterminate.

U (Non-detected): The compound or analyte was analyzed for and positively identified by the laboratory; however the compound or analyte should be considered non-detected at the reported concentration due to the presence of contaminants detected in the associated blank(s).

UJ (Non-detected estimated): The compound or analyte was reported as not detected by the laboratory; however the reported quantitation/detection limit is estimated due to non-conformances discovered during data validation.

R (Rejected): The sample results were rejected due to gross non-conformances discovered during data validation. Data qualified as rejected is not usable.

NA (Not Applicable): The non-conformance discovered during data validation demonstrates a high bias, while the affected compound or analyte in the associated sample(s) was reported as not detected by the laboratory and did not warrant the qualification of the data.

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

I. Sample Receipt and Technical Holding Times

All samples were received in good condition and cooler temperatures upon receipt met validation criteria.

All technical holding time requirements were met.

II. GC/MS Instrument Performance Check

A bromofluorobenzene (BFB) tune was performed at 12 hour intervals.

All ion abundance requirements were met.

III. Initial Calibration and Initial Calibration Verification

An initial calibration was performed as required by the method.

For compounds where average relative response factors (RRFs) were utilized, the percent relative standard deviations (%RSD) were less than or equal to 15.0%.

In the case where the laboratory used a calibration curve to evaluate the compounds, all coefficients of determination (r^2) were greater than or equal to 0.990.

Average relative response factors (RRF) for all compounds were within validation criteria.

The percent differences (%D) of the initial calibration verification (ICV) standard were less than or equal to 20.0% for all compounds.

IV. Continuing Calibration

Continuing calibration was performed at the required frequencies.

The percent differences (%D) were less than or equal to 20.0% for all compounds.

The percent differences (%D) of the ending continuing calibration verifications (CCVs) were less than or equal to 50.0% for all compounds.

All of the continuing calibration relative response factors (RRF) were within validation criteria.

V. Laboratory Blanks

Laboratory blanks were analyzed as required by the method. No contaminants were found in the laboratory blanks.

VI. Field Blanks

Sample 1935MOU2169A was identified as a trip blank. No contaminants were found.

VII. Surrogates

Surrogates were added to all samples as required by the method. All surrogate recoveries (%R) were within QC limits.

VIII. Matrix Spike/Matrix Spike Duplicates

Matrix spike (MS) and matrix spike duplicate (MSD) sample analysis was performed on an associated project sample. Percent recoveries (%R) were within QC limits. Relative percent differences (RPD) were within QC limits.

IX. Laboratory Control Samples

Laboratory control samples (LCS) were analyzed as required by the method. Percent recoveries (%R) were within QC limits.

X. Field Duplicates

Samples 1935MOU2171F and 1935MOU2172D were identified as field duplicates. No results were detected in any of the samples with the following exceptions:

Compound	Concentration (ug/L)		RPD (Limits)
	1935MOU2171F	1935MOU2172D	
Chloroform	0.18	0.18	0 (≤30)
1,1-Dichloroethane	1.0	1.1	10 (≤30)
1,2-Dichloroethane	0.24	0.24	0 (≤30)
cis-1,2-Dichloroethene	0.91	0.93	2 (≤30)
Tetrachloroethene	0.75	0.72	4 (≤30)
Trichloroethene	1.6	1.6	0 (≤30)

XI. Internal Standards

All internal standard areas and retention times were within QC limits.

XII. Compound Quantitation

All compound quantitations met validation criteria.

All compounds reported below the LOQ were qualified as follows:

Sample	Finding	Flag	A or P
1935YOU2033F 1935YOU2035F 1935YOU2039F 1935YOU2042F 1935MOU2170F 1935MOU2171F 1935MOU2172D 1935MOU2173F 1935MOU2174F 1935MOU2175F 1935MOU2176F 1935MOU2177F	All compounds reported below the LOQ.	J (all detects)	A

XIII. Target Compound Identifications

All target compound identifications met validation criteria.

XIV. System Performance

The system performance was acceptable.

XV. Overall Assessment of Data

The analysis was conducted within all specifications of the method. No results were rejected in this SDG.

Due to results below the LOQ, data were qualified as estimated in twelve samples.

The quality control criteria reviewed, other than those discussed above, were met and are considered acceptable.

VALIDATION FINDINGS CHECKLIST

Reviewer: Q
2nd Reviewer: KV

Method: Volatiles (EPA SW 846 Method 8260B-SIM)

Validation Area	Yes	No	NA	Findings/Comments
I. Technical holding times				
Were all technical holding times met?	✓			
Was cooler temperature criteria met?	✓			
II. GC/MS Instrument performance check (Not required)				
Were the BFB performance results reviewed and found to be within the specified criteria?	✓			
Were all samples analyzed within the 12 hour clock criteria?	✓			
IIIa. Initial calibration				
Did the laboratory perform a 5 point calibration prior to sample analysis?	✓			
Were all percent relative standard deviations (%RSD) ≤ 15% and relative response factors (RRF) ≥ 0.05??	✓			
Was a curve fit used for evaluation? If yes, did the initial calibration meet the curve fit acceptance criteria of ≥ 0.990?	✓			
IIIb. Initial Calibration Verification				
Was an initial calibration verification standard analyzed after each initial calibration for each instrument?	✓			
Were all percent difference (%D) ≤20% or percent recoveries (%R) 80-120%?	✓			
IV. Continuing calibration				
Was a continuing calibration standard analyzed at least once every 12 hours for each instrument?	✓			
Were all percent differences (%D) ≤ 20% and relative response factors (RRF) ≥ 0.05?	✓			
V. Laboratory Blanks				
Was a laboratory blank associated with every sample in this SDG?	✓			
Was a laboratory blank analyzed at least once every 12 hours for each matrix and concentration?	✓			
Was there contamination in the laboratory blanks? If yes, please see the Blanks validation findings worksheet.		✓		
VI. Field blanks				
Were field blanks identified in this SDG?	✓			
Were target compounds detected in the field blanks?		✓		
VII. Surrogate spikes				
Were all surrogate percent recovery (%R) within QC limits?	✓			
If the percent recovery (%R) for one or more surrogates was out of QC limits, was a reanalysis performed to confirm samples with %R outside of criteria?			✓	
VIII. Matrix spike/Matrix spike duplicates				
Were a matrix spike (MS) and matrix spike duplicate (MSD) analyzed for each matrix in this SDG?	✓			
Were the MS/MSD percent recoveries (%R) and the relative percent differences (RPD) within the QC limits?	✓			

LDC #: 45997116

VALIDATION FINDINGS CHECKLIST

Reviewer: 9T
2nd Reviewer: MK

Validation Area	Yes	No	NA	Findings/Comments
IX. Laboratory control samples				
Was an LCS analyzed for this SDG?	✓			
Was an LCS analyzed per analytical batch?	✓			
Were the LCS percent recoveries (%R) and relative percent difference (RPD) within the QC limits?	✓			
X. Field duplicates				
Were field duplicate pairs identified in this SDG?	✓			
Were target compounds detected in the field duplicates?	✓			
XI. Internal standards				
Were internal standard area counts within -50% or +100% of the associated calibration standard?	✓			
Were retention times within ± 30 seconds of the associated calibration standard?	✓			
XII. Compound quantitation				
Did the laboratory LOQs/RLs meet the QAPP LOQs/RLs?	✓			
Were the correct internal standard (IS), quantitation ion and relative response factor (RRF) used to quantitate the compound?	✓			
Were compound quantitation and RLs adjusted to reflect all sample dilutions and dry weight factors applicable to level IV validation?	✓			
XIII. Target compound identification				
Were relative retention times (RRT's) within ± 0.06 RRT units of the standard?	✓			
Did compound spectra meet specified EPA "Functional Guidelines" criteria?	✓			
Were chromatogram peaks verified and accounted for?	✓			
XIV. System performance				
System performance was found to be acceptable.	✓			
XV. Overall assessment of data				
Overall assessment of data was found to be acceptable.	✓

The Relative Response Factor (RRF), average RRF, and percent relative standard deviation (%RSD) were recalculated for the compounds identified below using the following calculations:

$RRF = (A_x)(C_{is})/(A_{is})(C_x)$
average RRF = sum of the RRFs/number of standards
%RSD = 100 * (S/X)

A_x = Area of compound,
C_x = Concentration of compound,
S = Standard deviation of the RRFs
X = Mean of the RRFs

A_{is} = Area of associated internal standard
C_{is} = Concentration of internal standard

#	Standard ID	Calibration Date	Compound (Reference Internal Standard)	Reported RRF (10 std)	Recalculated RRF (10 std)	Reported Average RRF (initial)	Recalculated Average RRF (initial)	Reported %RSD	Recalculated %RSD

Sample Identification	Laboratory Sample Identification	Matrix	Collection Date
1935YOU2032F	FA67649-1	Water	08/28/19

Introduction

This Data Validation Report (DVR) presents data validation findings and results for the associated samples listed on the cover page. Data validation was performed in accordance with the Final Quality Assurance Project Plan Volume I, Appendix A for Groundwater Remedies and Monitoring at Operable Unit 2, Sites 2 and 12, and Operable Unit Carbon Tetrachloride Plume, Former Fort Ord, California (Revision 7, August 2019), the U.S. Department of Defense (DoD) Quality Systems Manual (QSM) for Environmental Laboratories, Version 5.1 (2017), and the USACE Guidance for Evaluating Performance-Based Chemical Data (June 2005). Where specific guidance was not available, the data has been evaluated in a conservative manner consistent with industry standards using professional experience.

The analyses were performed by the following method:

Antimony, Copper, and Lead by Environmental Protection Agency (EPA) SW 846 Method 6010C

All sample results were subjected to Stage 4 evaluation, which is comprised of the quality control (QC) summary forms as well as the raw data, to confirm sample quantitation and identification.

The following are definitions of the data qualifiers utilized during data validation:

J+ (Estimated, High Bias): The compound or analyte was analyzed for and positively identified by the laboratory; however the reported concentration is estimated, displaying high bias, due to non-conformances discovered during data validation.

J- (Estimated, Low Bias): The compound or analyte was analyzed for and positively identified by the laboratory; however the reported concentration is estimated, displaying low bias, due to non-conformances discovered during data validation.

J (Estimated, Bias Indeterminate): The compound or analyte was analyzed for and positively identified by the laboratory; however the reported concentration is estimated due to non-conformances discovered during data validation. Bias is indeterminate.

U (Non-detected): The compound or analyte was analyzed for and positively identified by the laboratory; however the compound or analyte should be considered non-detected at the reported concentration due to the presence of contaminants detected in the associated blank(s).

UJ (Non-detected estimated): The compound or analyte was reported as not detected by the laboratory; however the reported quantitation/detection limit is estimated due to non-conformances discovered during data validation.

R (Rejected): The sample results were rejected due to gross non-conformances discovered during data validation. Data qualified as rejected is not usable.

NA (Not Applicable): The non-conformance discovered during data validation demonstrates a high bias, while the affected compound or analyte in the associated sample(s) was reported as not detected by the laboratory and did not warrant the qualification of the data.

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

I. Sample Receipt and Technical Holding Times

All samples were received in good condition.

All technical holding time requirements were met.

II. Instrument Calibration

Initial and continuing calibrations were performed as required by the method.

The initial calibration verification (ICV) and continuing calibration verification (CCV) standards were within QC limits.

III. ICP Interference Check Sample Analysis

The frequency of interference check sample (ICS) analysis was met. All criteria were within QC limits.

IV. Laboratory Blanks

Laboratory blanks were analyzed as required by the methods. No contaminants were found in the laboratory blanks with the following exceptions:

Blank ID	Analyte	Maximum Concentration	Associated Samples
PB (prep blank)	Antimony	2.0 ug/L	1935YOU2032F
ICB/CCB	Antimony	2.80 ug/L	1935YOU2032F

Data qualification by the laboratory blanks was based on the maximum contaminant concentration in the laboratory blanks in the analysis of each analyte. The sample concentrations were either not detected or were significantly greater (>5X blank contaminants) than the concentrations found in the associated laboratory blanks with the following exceptions:

Sample	Analyte	Reported Concentration	Modified Final Concentration
1935YOU2032F	Antimony	1.5 ug/L	1.5U ug/L

V. Field Blanks

No field blanks were identified in this SDG.

VI. Matrix Spike/Matrix Spike Duplicates

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

VII. Duplicate Sample Analysis

The laboratory has indicated that there were no duplicate (DUP) analyses specified for the samples in this SDG, and therefore duplicate analyses were not performed for this SDG.

VIII. Serial Dilution

Serial dilution was not performed for this SDG.

IX. Laboratory Control Samples

Laboratory control samples (LCS) were analyzed as required by the method. Percent recoveries (%R) were within QC limits.

X. Field Duplicates

No field duplicates were identified in this SDG for samples reviewed at Stage 4.

XI. Sample Result Verification

All sample result verifications were acceptable.

All analytes reported below the LOQ were qualified as follows:

Sample	Finding	Flag	A or P
1935YOU2032F	All analytes reported below the LOQ.	J (all detects)	A

XII. Overall Assessment of Data

The analysis was conducted within all specifications of the method. No results were rejected in this SDG.

Due to results below the LOQ, data were qualified as estimated in one sample.

Due to laboratory blank contamination, data were qualified as not detected in one sample.

The quality control criteria reviewed, other than those discussed above, were met and are considered acceptable.

Were all instruments calibrated daily, each set-up time?	✓			
Were the proper number of standards used?	✓			
Were all initial and continuing calibration verification %Rs within the 90-110% (80-120% for mercury) QC limits?	✓			
Were the low standard checks within 70-130%	✓			
Were all initial calibration correlation coefficients within limits as specified by the method?	✓			
IV. Blanks				
Was a method blank associated with every sample in this SDG?	✓			
Was there contamination in the method blanks? If yes, please see the Blanks validation completeness worksheet.	✓			
V. ICP Interference Check Sample				
Were ICP interference check samples performed daily?	✓			
Were the AB solution percent recoveries (%R) with the 80-120% QC limits?	✓			
VI. Matrix spike/Matrix spike duplicates				
Were a matrix spike (MS) and duplicate (DUP) analyzed for each matrix in this SDG? If no, indicate which matrix does not have an associated MS/MSD or MS/DUP. Soil / Water.		✓		
Were the MS/MSD percent recoveries (%R) and the relative percent differences (RPD) within the 75-125 QC limits? If the sample concentration exceeded the spike concentration by a factor of 4 or more, no action was taken.			✓	
Were the MS/MSD or duplicate relative percent differences (RPD) ≤ 20% for waters and ≤ 35% for soil samples? A control limit of +/- RL(+/-2X RL for soil) was used for samples that were ≤ 5X the RL, including when only one of the duplicate sample values were ≤ 5X the RL.			✓	
VII. Laboratory control samples				
Was an LCS anaylzed for this SDG?	✓			
Was an LCS analyzed per extraction batch?	✓			
Were the LCS percent recoveries (%R) and relative percent difference (RPD) within the 80-120% QC limits for water samples and laboratory established QC limits for soils?	✓			

Validation Area	Yes	No	NA	Findings/Comments
VIII. Internal Standards (EPA SW 846 Method 6020/EPA 200.8)				
Were all the percent recoveries (%R) within the 30-120% (6020)/60-125% (200.8) of the intensity of the internal standard in the associated initial calibration?			✓	
If the %Rs were outside the criteria, was a reanalysis performed?			✓	
IX. ICP Serial Dilution				
Was an ICP serial dilution analyzed if analyte concentrations were > 50X the MDL (ICP)/>100X the MDL(ICP/MS)?		✓		
Were all percent differences (%Ds) < 10%?			✓	
Was there evidence of negative interference? If yes, professional judgement will be used to qualify the data.			✓	
X. Sample Result Verification				
Were RLs adjusted to reflect all sample dilutions and dry weight factors applicable to level IV validation?	✓			
XI. Overall assessment of data				
Overall assessment of data was found to be acceptable.	✓			
XII. Field duplicates				
Field duplicate pairs were identified in this SDG.	✓	~~✓~~ KK		Not Stage 4
Target analytes were detected in the field duplicates.			✓	
XIII. Field blanks				
Field blanks were identified in this SDG.		✓		
Target analytes were detected in the field blanks.			✓

Introduction

This Data Validation Report (DVR) presents data validation findings and results for the associated samples listed on the cover page. Data validation was performed in accordance with the Final Quality Assurance Project Plan Volume I, Appendix A for Groundwater Remedies and Monitoring at Operable Unit 2, Sites 2 and 12, and Operable Unit Carbon Tetrachloride Plume, Former Fort Ord, California (Revision 7, August 2019), the U.S. Department of Defense (DoD) Quality Systems Manual (QSM) for Environmental Laboratories, Version 5.1 (2017), and the USACE Guidance for Evaluating Performance-Based Chemical Data (June 2005). Where specific guidance was not available, the data has been evaluated in a conservative manner consistent with industry standards using professional experience.

The analyses were performed by the following methods:

Chloride by Environmental Protection Agency (EPA) Method 300.0/EPA SW 846 Method 9056A

All sample results were subjected to Stage 4 data validation, which is comprised of the quality control (QC) summary forms as well as the raw data, to confirm sample quantitation and identification.

The following are definitions of the data qualifiers utilized during data validation:

J+ (Estimated, High Bias): The compound or analyte was analyzed for and positively identified by the laboratory; however the reported concentration is estimated, displaying high bias, due to non-conformances discovered during data validation.

J- (Estimated, Low Bias): The compound or analyte was analyzed for and positively identified by the laboratory; however the reported concentration is estimated, displaying low bias, due to non-conformances discovered during data validation.

J (Estimated, Bias Indeterminate): The compound or analyte was analyzed for and positively identified by the laboratory; however the reported concentration is estimated due to non-conformances discovered during data validation. Bias is indeterminate.

U (Non-detected): The compound or analyte was analyzed for and positively identified by the laboratory; however the compound or analyte should be considered non-detected at the reported concentration due to the presence of contaminants detected in the associated blank(s).

UJ (Non-detected estimated): The compound or analyte was reported as not detected by the laboratory; however the reported quantitation/detection limit is estimated due to non-conformances discovered during data validation.

R (Rejected): The sample results were rejected due to gross non-conformances discovered during data validation. Data qualified as rejected is not usable.

NA (Not Applicable): The non-conformance discovered during data validation demonstrates a high bias, while the affected compound or analyte in the associated sample(s) was reported as not detected by the laboratory and did not warrant the qualification of the data.

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

I. Sample Receipt and Technical Holding Times

All samples were received in good condition.

All technical holding time requirements were met.

II. Initial Calibration

All criteria for the initial calibration of each method were met.

III. Continuing Calibration

Continuing calibration frequency and analysis criteria were met for each method when applicable.

IV. Laboratory Blanks

Laboratory blanks were analyzed as required by the methods. No contaminants were found in the laboratory blanks.

V. Field Blanks

No field blanks were identified in this SDG.

VI. Matrix Spike/Matrix Spike Duplicates

Matrix spike (MS) and matrix spike duplicate (MSD) sample analysis was performed on an associated project sample. Percent recoveries (%R) were not within QC limits. No data were qualified since there were no associated samples reviewed at Stage 4 in this SDG. Relative percent differences (RPD) were within QC limits.

VII. Duplicate Sample Analysis

The laboratory has indicated that there were no duplicate (DUP) analyses specified for the samples in this SDG, and therefore duplicate analyses were not performed for this SDG.

VIII. Laboratory Control Samples

Laboratory control samples (LCS) were analyzed as required by the methods. Percent recoveries (%R) were within QC limits.

IX. Field Duplicates

No field duplicates were identified in this SDG for samples reviewed at Stage 4.

X. Sample Result Verification

All sample result verifications were acceptable.

XI. Overall Assessment of Data

The analysis was conducted within all specifications of the methods. No results were rejected in this SDG.

The quality control criteria reviewed were met and are considered acceptable.

Validation Findings Worksheet
Initial and Continuing Calibration Calculation Verification

Reviewer: KK
2nd Reviewer: C

Method: Inorganics, Method See Cover

The correlation coefficient (r) for the calibration of Cl was recalculated. Calibration date: 8/27/19

An initial or continuing calibration verification percent recovery (%R) was recalculated for each type of analysis using the following formula:

%R = Found X 100 / True

Where, Found = concentration of each analyte measured in the analysis of the ICV or CCV solution

True = concentration of each analyte in the ICV or CCV source

Type of analysis	Analyte	Found Standard	True Conc. (mg/l)	Area	Recalculated r or r^2	Reported r or r^2	Acceptable (Y/N)
Initial calibration	Cl	s1	1	0.040	0.999153	0.996527	Y
		s2	2.5	0.119			
		s3	5	0.289			
		s4	10	0.568			
		s5	20	1.193			
		s6	50	3.450			
		s7	100	7.416			
ICV 8/27 17:26 Calibration verification	Cl	47.70	50		95.4	95.4	Y
CCV4 ~~8/27~~ 9/5 17:49 Calibration verification	Cl	48.20	50		96.4	96.4	Y
Calibration verification							

Comments: Refer to Calibration Verification findings worksheet for list of qualifications and associated samples when reported results do not agree within 10.0% of the recalculated results.

Percent recoveries (%R) for a laboratory control sample and a matrix spike sample were recalculated using the following formula:

%R = Found / True x 100 Where, Found = concentration of each analyte measured in the analysis of the sample. For the matrix spike calculation, Found = SSR (spiked sample result) - SR (sample result).
True = concentration of each analyte in the source.

A sample and duplicate relative percent difference (RPD) was recalculated using the following formula:

RPD = |S-D| / (S+D)/2 x 100 Where, S = Original sample concentration
D = Duplicate sample concentration

Sample ID	Type of Analysis	Element	Found / S (units)	True / D (units)	Recalculated %R / RPD	Reported %R / RPD	Acceptable (Y/N)
LCS	Laboratory control sample	Cl	48.4585 mg/L	50 mg/L	97	97.0	Y
6	Matrix spike sample	↓	(SSR-SR) -33.04 mg/L	50 mg/L	-66.1	-66.0	Y
7	Duplicate sample	↓	375	~~377~~ 388 mg/L	3.4	3.4	Y

Introduction

This Data Validation Report (DVR) presents data validation findings and results for the associated samples listed on the cover page. Data validation was performed in accordance with the Final Quality Assurance Project Plan Volume I, Appendix A for Groundwater Remedies and Monitoring at Operable Unit 2, Sites 2 and 12, and Operable Unit Carbon Tetrachloride Plume, Former Fort Ord, California (Revision 7, August 2019), the U.S. Department of Defense (DoD) Quality Systems Manual (QSM) for Environmental Laboratories, Version 5.1 (2017), and the USACE Guidance for Evaluating Performance-Based Chemical Data (June 2005). Where specific guidance was not available, the data has been evaluated in a conservative manner consistent with industry standards using professional experience.

The analyses were performed by the following method:

Volatile Organic Compounds (VOCs) by Environmental Protection Agency (EPA) SW 846 Method 8260B in Selected Ion Monitoring (SIM) mode

All sample results were subjected to Stage 4 data validation, which is comprised of the quality control (QC) summary forms as well as the raw data, to confirm sample quantitation and identification.

The following are definitions of the data qualifiers utilized during data validation:

J+ (Estimated, High Bias): The compound or analyte was analyzed for and positively identified by the laboratory; however the reported concentration is estimated, displaying high bias, due to non-conformances discovered during data validation.

J- (Estimated, Low Bias): The compound or analyte was analyzed for and positively identified by the laboratory; however the reported concentration is estimated, displaying low bias, due to non-conformances discovered during data validation.

J (Estimated, Bias Indeterminate): The compound or analyte was analyzed for and positively identified by the laboratory; however the reported concentration is estimated due to non-conformances discovered during data validation. Bias is indeterminate.

U (Non-detected): The compound or analyte was analyzed for and positively identified by the laboratory; however the compound or analyte should be considered non-detected at the reported concentration due to the presence of contaminants detected in the associated blank(s).

UJ (Non-detected estimated): The compound or analyte was reported as not detected by the laboratory; however the reported quantitation/detection limit is estimated due to non-conformances discovered during data validation.

R (Rejected): The sample results were rejected due to gross non-conformances discovered during data validation. Data qualified as rejected is not usable.

NA (Not Applicable): The non-conformance discovered during data validation demonstrates a high bias, while the affected compound or analyte in the associated sample(s) was reported as not detected by the laboratory and did not warrant the qualification of the data.

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

I. Sample Receipt and Technical Holding Times

All samples were received in good condition and cooler temperatures upon receipt met validation criteria.

All technical holding time requirements were met.

II. GC/MS Instrument Performance Check

A bromofluorobenzene (BFB) tune was performed at 12 hour intervals.

All ion abundance requirements were met.

III. Initial Calibration and Initial Calibration Verification

An initial calibration was performed as required by the method.

For compounds where average relative response factors (RRFs) were utilized, the percent relative standard deviations (%RSD) were less than or equal to 15.0%.

In the case where the laboratory used a calibration curve to evaluate the compounds, all coefficients of determination (r^2) were greater than or equal to 0.990.

Average relative response factors (RRF) for all compounds were within validation criteria.

The percent differences (%D) of the initial calibration verification (ICV) standard were less than or equal to 20.0% for all compounds.

IV. Continuing Calibration

Continuing calibration was performed at the required frequencies.

The percent differences (%D) were less than or equal to 20.0% for all compounds with the following exceptions:

Date	Compound	%D	Associated Samples	Flag	A or P
09/09/19	Methylene chloride	21.0	1935X0BW087F 1935X0BW088D 1935X0BW089F	NA	-

The percent differences (%D) of the ending continuing calibration verifications (CCVs) were less than or equal to 50.0% for all compounds.

All of the continuing calibration relative response factors (RRF) were within validation criteria.

V. Laboratory Blanks

Laboratory blanks were analyzed as required by the method. No contaminants were found in the laboratory blanks with the following exceptions:

Blank ID	Analysis Date	Compound	Concentration	Associated Samples
V02268-BLK1	09/09/19	Methylene chloride	2.0 ug/L	1935X0BW087F 1935X0BW088D 1935X0BW089F

Sample concentrations were compared to concentrations detected in the laboratory blanks. The sample concentrations were either not detected or were significantly greater (>10X for common contaminants, >5X for other contaminants) than the concentrations found in the associated laboratory blanks.

VI. Field Blanks

Sample 1935Z0BW006A (from SDG FA67650) was identified as a trip blank. No contaminants were found.

Sample 1935W0BW019B was identified as an equipment blank. No contaminants were found.

VII. Surrogates

Surrogates were added to all samples as required by the method. All surrogate recoveries (%R) were within QC limits with the following exceptions:

Sample	Surrogate	%R (Limits)	Affected Compound	Flag	A or P
1935X0BW077D	1,2-Dichloroethane-d4	126 (74-125)	Methylene chloride	NA	-
1935X0BW079F	1,2-Dichloroethane-d4	126 (74-125)	All compounds	NA	-
1935X0BW080F	1,2-Dichloroethane-d4 Toluene-d8	126 (74-125) 84 (88-111)	Methylene chloride	UJ (all non-detects)	A
1935X0BW081F	1,2-Dichloroethane-d4	128 (74-125)	Methylene chloride	NA	-

VIII. Matrix Spike/Matrix Spike Duplicates

Matrix spike (MS) and matrix spike duplicate (MSD) sample analysis was performed on an associated project sample. Percent recoveries (%R) were within QC limits with the following exceptions:

Spike ID (Associated Samples)	Compound	MS (%R) (Limits)	MSD (%R) (Limits)	Flag	A or P
1935X0BW087FMS/MSD (1935X0BW087F)	Methylene chloride	138 (69-135)	136 (69-135)	NA	-

Relative percent differences (RPD) were within QC limits.

IX. Laboratory Control Samples

Laboratory control samples (LCS) were analyzed as required by the method. Percent recoveries (%R) were within QC limits.

X. Field Duplicates

Samples 1935X0BW076F and 1935X0BW077D and samples 1935X0BW087F and 1935X0BW088D were identified as field duplicates. No results were detected in any of the samples with the following exceptions:

Compound	Concentration (ug/L)		RPD (Limits)
	1935X0BW076F	1935X0BW077D	
Trichloroethene	0.31	0.27	14 (≤30)

Compound	Concentration (ug/L)		RPD (Limits)
	1935X0BW087F	1935X0BW088D	
1,2-Dichloroethene, total	0.17	0.18	6 (≤30)
Trichloroethene	1.1	0.94	16 (≤30)

XI. Internal Standards

All internal standard areas and retention times were within QC limits.

XII. Compound Quantitation

All compound quantitations met validation criteria.

All compounds reported below the LOQ were qualified as follows:

Sample	Finding	Flag	A or P
1935W0BW018F 1935X0BW075F 1935X0BW076F 1935X0BW077D 1935X0BW078F 1935X0BW080F 1935X0BW087F 1935X0BW088D 1935X0BW089F	All compounds reported below the LOQ.	J (all detects)	A

XIII. Target Compound Identifications

All target compound identifications met validation criteria.

XIV. System Performance

The system performance was acceptable.

XV. Overall Assessment of Data

The analysis was conducted within all specifications of the method. No results were rejected in this SDG.

Due to surrogate %R and results below the LOQ, data were qualified as estimated in nine samples.

The quality control criteria reviewed, other than those discussed above, were met and are considered acceptable.

VALIDATION FINDINGS CHECKLIST

Reviewer: 9
2nd Reviewer: KW

Method: Volatiles (EPA SW 846 Method 8260B-SIM)

Validation Area	Yes	No	NA	Findings/Comments
I. Technical holding times				
Were all technical holding times met?	✓			
Was cooler temperature criteria met?	✓			
II. GC/MS Instrument performance check (Not required)				
Were the BFB performance results reviewed and found to be within the specified criteria?	✓			
Were all samples analyzed within the 12 hour clock criteria?	✓			
IIIa. Initial calibration				
Did the laboratory perform a 5 point calibration prior to sample analysis?	✓			
Were all percent relative standard deviations (%RSD) ≤ 15% and relative response factors (RRF) ≥ 0.05??	✓			
Was a curve fit used for evaluation? If yes, did the initial calibration meet the curve fit acceptance criteria of ≥ 0.990?	✓			
IIIb. Initial Calibration Verification				
Was an initial calibration verification standard analyzed after each initial calibration for each instrument?	✓			
Were all percent difference (%D) ≤20% or percent recoveries (%R) 80-120%?	✓			
IV. Continuing calibration				
Was a continuing calibration standard analyzed at least once every 12 hours for each instrument?	✓			
Were all percent differences (%D) ≤ 20% and relative response factors (RRF) ≥ 0.05?		✓		
V. Laboratory Blanks				
Was a laboratory blank associated with every sample in this SDG?	✓			
Was a laboratory blank analyzed at least once every 12 hours for each matrix and concentration?	✓			
Was there contamination in the laboratory blanks? If yes, please see the Blanks validation findings worksheet.	✓			
VI. Field blanks				
Were field blanks identified in this SDG?	✓			
Were target compounds detected in the field blanks?		✓		
VII. Surrogate spikes				
Were all surrogate percent recovery (%R) within QC limits?	✓	✓		
If the percent recovery (%R) for one or more surrogates was out of QC limits, was a reanalysis performed to confirm samples with %R outside of criteria?		✓		
VIII. Matrix spike/Matrix spike duplicates				
Were a matrix spike (MS) and matrix spike duplicate (MSD) analyzed for each matrix in this SDG?	✓			
Were the MS/MSD percent recoveries (%R) and the relative percent differences (RPD) within the QC limits?		✓

Validation Area	Yes	No	NA	Findings/Comments
IX. Laboratory control samples				
Was an LCS analyzed for this SDG?	✓			
Was an LCS analyzed per analytical batch?	✓			
Were the LCS percent recoveries (%R) and relative percent difference (RPD) within the QC limits?	✓			
X. Field duplicates				
Were field duplicate pairs identified in this SDG?	✓			
Were target compounds detected in the field duplicates?	✓			
XI. Internal standards				
Were internal standard area counts within -50% or +100% of the associated calibration standard?	✓			
Were retention times within ± 30 seconds of the associated calibration standard?	✓			
XII. Compound quantitation				
Did the laboratory LOQs/RLs meet the QAPP LOQs/RLs?	✓			
Were the correct internal standard (IS), quantitation ion and relative response factor (RRF) used to quantitate the compound?	✓			
Were compound quantitation and RLs adjusted to reflect all sample dilutions and dry weight factors applicable to level IV validation?	✓			
XIII. Target compound identification				
Were relative retention times (RRT's) within ± 0.06 RRT units of the standard?	✓			
Did compound spectra meet specified EPA "Functional Guidelines" criteria?	✓			
Were chromatogram peaks verified and accounted for?	✓			
XIV. System performance				
System performance was found to be acceptable.	✓			
XV. Overall assessment of data				
Overall assessment of data was found to be acceptable.	✓

METHOD: GC/MS VOA (EPA SW 846 Method 8260B)

The Relative Response Factor (RRF), average RRF, and percent relative standard deviation (%RSD) were recalculated for the compounds identified below using the following calculations:

$RRF = (A_x)(C_{is})/(A_{is})(C_x)$
average RRF = sum of the RRFs/number of standards
%RSD = 100 * (S/X)

A_x = Area of compound,
C_x = Concentration of compound,
S = Standard deviation of the RRFs
X = Mean of the RRFs

A_{is} = Area of associated internal standard
C_{is} = Concentration of internal standard

#	Standard ID	Calibration Date	Compound (Reference Internal Standard)	Reported RRF (10 std)	Recalculated RRF (10 std)	Reported Average RRF (initial)	Recalculated Average RRF (initial)	Reported %RSD	Recalculated %RSD

Continuing Calibration Results Verification

Reviewer: PG
2nd Reviewer: [illegible]

METHOD: GC/MS VOA (EPA SW 846 Method 8260B-SIM)

The percent difference (%D) of the initial calibration average Relative Response Factors (RRFs) and the continuing calibration RRFs were recalculated for the compounds identified below using the following calculation:

% Difference = 100 * (ave. RRF - RRF)/ave. RRF
$RRF = (A_x)(C_{is})/(A_{is})(C_x)$

Where: ave. RRF = initial calibration average RRF
RRF = continuing calibration RRF
A_x = Area of compound, A_{is} = Area of associated internal standard
C_x = Concentration of compound, C_{is} = Concentration of internal standard

Y N N/A Were all reported results recalculated and verified for all level IV samples?
Y N N/A Were all recalculated results for detected target compounds agree within 10.0% of the reported results?

Concentration = $\frac{(A_x)(I_s)(DF)}{(A_{is})(RRF)(V_o)(\%S)}$

A_x = Area of the characteristic ion (EICP) for the compound to be measured

A_{is} = Area of the characteristic ion (EICP) for the specific internal standard

I_s = Amount of internal standard added in nanograms (ng)

RRF = Relative response factor of the calibration standard.

V_o = Volume or weight of sample pruged in milliliters (ml) or grams (g).

Df = Dilution factor.

%S = Percent solids, applicable to soils and solid matrices only.

Example:

Sample I.D. 3 , 5 :

Conc. = $\frac{(94659)(5.00)(1)}{(174445)(0.435)(\quad)(\quad)}$

= 0.62 ug/L

1 Sample and 1 Trip Blank collected on 08/27/2019 and were received at SGS North America Inc - Orlando on 08/28/2019 properly preserved, at 2 Deg. C and intact. These Samples received an SGS Orlando job number of FA67546. A listing of the Laboratory Sample ID, Client Sample ID and dates of collection are presented in the Results Summary Section. Except as noted below, all method specified calibrations and quality control performance criteria were met for this job. For more information, please refer to QC summary pages.

MS Volatiles By Method SW846 8260B BY SIM

Matrix: AQ **Batch ID:** VO2260

All samples were analyzed within the recommended method holding time.

Sample(s) FA67546-2MS, FA67546-2MSD were used as the QC samples indicated.

All method blanks for this batch meet method specific criteria.

SGS Orlando certifies that this report meets the project requirements for analytical data produced for the samples as received at SGS Orlando and as stated on the COC. SGS Orlando certifies that the data meets the Data Quality Objectives for precision, accuracy and completeness as specified in the SGS Orlando Quality Manual except as noted above. This report is to be used in its entirety. SGS Orlando is not responsible for any assumptions of data quality if partial data packages are used.

Response via : Initial Calibration

Compound	R.T.	QIon	Response	Conc	Units	Dev(Min)
Internal Standards						
1) Fluorobenzene	7.352	96	984555	5.00	ug/L	0.00
19) Chlorobenzene-d5	10.453	117	696564	5.00	ug/L	0.00
System Monitoring Compounds						
10) Dibromofluoromethane	6.528	113	264726	4.06	ug/L	0.00
Spiked Amount 5.000	Range 83 - 118		Recovery = 81.20%#			
14) 1,2-Dichloroethane-d4	7.080	65	334286	4.22	ug/L	0.00
Spiked Amount 5.000	Range 74 - 125		Recovery = 84.40%			
20) Toluene-d8	8.904	98	842121	5.76	ug/L	0.00
Spiked Amount 5.000	Range 88 - 111		Recovery = 115.20%#			
Target Compounds						Qvalue
2) Vinyl Chloride	2.908	62	954557	8.97	ug/L	99
3) Chloromethane	2.803	50	1590554	9.39	ug/L	99
4) 1,1-Dichloroethene	4.089	61	1487352	10.36	ug/L	100
5) Methylene Chloride	4.703	49	2554176	10.41	ug/L	97
6) trans-1,2-Dichloroethene	4.869	61	1836700	10.94	ug/L	98
7) 1,1-Dichloroethane	5.514	63	2096406	10.88	ug/L	99
8) cis-1,2-Dichloroethene	6.072	96	1095181	11.97	ug/L	99
9) Chloroform	6.333	83	1665835	10.83	ug/L	98
11) Carbon Tetrachloride	6.511	117	1126120	11.35	ug/L	99
12) 1,1,1-Trichloroethane	6.582	97	1334267	11.77	ug/L	94
13) Benzene	6.949	78	3659590	11.31	ug/L	94
15) 1,2-Dichloroethane	7.145	62	1646326	10.75	ug/L	98
16) Trichloroethene	7.518	95	1133106	11.14	ug/L	95
17) 1,2-Dichloropropane	8.047	63	1323974	12.15	ug/L	95
18) cis-1,3-Dichloropropene	8.719	75	1568519	15.22	ug/L	96
21) trans-1,3-Dichloropropene	9.353	75	1380700	16.45	ug/L	97
22) Tetrachloroethene	9.345	166	971454	13.23	ug/L	99

SAMPLE DELIVERY GROUP CASE NARRATIVE

Client: Ahtna Environmental Inc **Job No:** FA67560

Site: Fort Ord Groundwater Monitoring **Report Date:** 9/5/2019 5:40:49 PM

3 Samples and 1 Trip Blank were collected on 08/26/2019 and were received at SGS North America Inc - Orlando on 08/28/2019 properly preserved, at 3 Deg. C and intact. These Samples received an SGS Orlando job number of FA67560. A listing of the Laboratory Sample ID, Client Sample ID and dates of collection are presented in the Results Summary Section. Except as noted below, all method specified calibrations and quality control performance criteria were met for this job. For more information, please refer to QC summary pages.

MS Volatiles By Method SW846 8260B BY SIM

Matrix: AQ **Batch ID:** VO2261

All samples were analyzed within the recommended method holding time.

Sample(s) FA67558-1MS, FA67558-1MSD were used as the QC samples indicated.

All method blanks for this batch meet method specific criteria.

Matrix: AQ **Batch ID:** VO2262

All samples were analyzed within the recommended method holding time.

Sample(s) FA67560-3MS, FA67560-3MSD were used as the QC samples indicated.

All method blanks for this batch meet method specific criteria.

SGS Orlando certifies that this report meets the project requirements for analytical data produced for the samples as received at SGS Orlando and as stated on the COC. SGS Orlando certifies that the data meets the Data Quality Objectives for precision, accuracy and completeness as specified in the SGS Orlando Quality Manual except as noted above. This report is to be used in its entirety. SGS Orlando is not responsible for any assumptions of data quality if partial data packages are used.

SAMPLE DELIVERY GROUP CASE NARRATIVE

Client: Ahtna Environmental Inc **Job No:** FA67615

Site: Fort Ord Groundwater Monitoring **Report Date:** 9/5/2019 5:43:52 PM

19 Samples and 1 Trip Blank were collected on 08/27/2019 and were received at SGS North America Inc - Orlando on 08/29/2019 properly preserved, at 1.4 Deg. C and intact. These Samples received an SGS Orlando job number of FA67615. A listing of the Laboratory Sample ID, Client Sample ID and dates of collection are presented in the Results Summary Section. Except as noted below, all method specified calibrations and quality control performance criteria were met for this job. For more information, please refer to QC summary pages.

MS Volatiles By Method SW846 8260B BY SIM

Matrix: AQ **Batch ID:** VZ2206

All samples were analyzed within the recommended method holding time.

Sample(s) FA67615-1MS, FA67615-1MSD were used as the QC samples indicated.

All method blanks for this batch meet method specific criteria.

FA67615-19 for Toluene-D8: Outside DOD QSM control limits.

SGS Orlando certifies that this report meets the project requirements for analytical data produced for the samples as received at SGS Orlando and as stated on the COC. SGS Orlando certifies that the data meets the Data Quality Objectives for precision, accuracy and completeness as specified in the SGS Orlando Quality Manual except as noted above. This report is to be used in its entirety. SGS Orlando is not responsible for any assumptions of data quality if partial data packages are used.

SGS Sample Receipt Summary

Job Number: FA67615 **Client:** AHTNA **Project:** Fort Ord 3Q2019 212 Report

Date / Time Received: 8/29/2019 9:00:00 AM **Delivery Method:** FedEx **Airbill #'s:** 776105005607

Therm ID: IR 1; **Therm CF:** 1; **# of Coolers:** 1

Cooler Temps (Raw Measured) °C: Cooler 1: (0.4);

Cooler Temps (Corrected) °C: Cooler 1: (1.4);

Cooler Information	Y	or	N
1. Custody Seals Present	☑		☐
2. Custody Seals Intact	☑		☐
3. Temp criteria achieved	☑		☐
4. Cooler temp verification	IR Gun		
5. Cooler media	Ice (Bag)		

Trip Blank Information	Y	or	N	N/A
1. Trip Blank present / cooler	☑		☐	☐
2. Trip Blank listed on COC	☑		☐	☐

	W	or	S	N/A
3. Type Of TB Received	☑		☐	☐

Sample Information	Y	or	N	N/A
1. Sample labels present on bottles	☑		☐	
2. Samples preserved properly	☑		☐	
3. Sufficient volume/containers recvd for analysis:	☑		☐	
4. Condition of sample	Intact			
5. Sample recvd within HT	☑		☐	
6. Dates/Times/IDs on COC match Sample Label	☑		☐	
7. VOCs have headspace	☐		☑	☐
8. Bottles received for unspecified tests	☐		☑	
9. Compositing instructions clear	☐		☐	☑
10. Voa Soil Kits/Jars received past 48hrs?	☐		☐	☑
11. % Solids Jar received?	☐		☐	☑
12. Residual Chlorine Present?	☐		☐	☑

Misc. Information

Number of Encores: 25-Gram _____ 5-Gram _____ Number of 5035 Field Kits: _____ Number of Lab Filtered Metals: _____

Test Strip Lot #s: pH 0-3 230315 pH 10-12 219813A Other: (Specify) _____ _____

SAMPLE DELIVERY GROUP CASE NARRATIVE

Client: Ahtna Environmental Inc **Job No:** FA67651

Site: Fort Ord Groundwater Monitoring **Report Date:** 9/10/2019 6:22:54 PM

5 Samples and 2 Trip Blanks were collected on 08/28/2019 and were received at SGS North America Inc - Orlando on 08/30/2019 properly preserved, at 2.4 Deg. C and intact. These Samples received an SGS Orlando job number of FA67651. A listing of the Laboratory Sample ID, Client Sample ID and dates of collection are presented in the Results Summary Section. Except as noted below, all method specified calibrations and quality control performance criteria were met for this job. For more information, please refer to QC summary pages.

MS Volatiles By Method SW846 8260B BY SIM

Matrix: AQ **Batch ID:** VO2266

All samples were analyzed within the recommended method holding time.

Sample(s) FA67651-6MS, FA67651-6MSD were used as the QC samples indicated.

All method blanks for this batch meet method specific criteria.

General Chemistry By Method EPA 300/SW846 9056A

Matrix: AQ **Batch ID:** GP33609

All samples were prepped within the recommended method holding time.

All samples were analyzed within the recommended method holding time.

All method blanks for this batch meet method specific criteria.

Sample(s) FA67651-6MSD, FA67651-6MS were used as the QC samples for Chloride.

Matrix Spike Recovery(s) for Chloride are outside control limits. Spike amount low relative to the sample amount. Refer to lab control or spike blank for recovery information.

Matrix Spike Duplicate Recovery(s) for Chloride are outside control limits. Probable cause is due to matrix interference.

SGS Orlando certifies that this report meets the project requirements for analytical data produced for the samples as received at SGS Orlando and as stated on the COC. SGS Orlando certifies that the data meets the Data Quality Objectives for precision, accuracy and completeness as specified in the SGS Orlando Quality Manual except as noted above. This report is to be used in its entirety. SGS Orlando is not responsible for any assumptions of data quality if partial data packages are used.

SGS Sample Receipt Summary

Job Number: FA67651 **Client:** AHTNA **Project:** Fort Ord 3Q19 212 Report

Date / Time Received: 8/30/2019 9:00:00 AM **Delivery Method:** FedEx **Airbill #'s:** 776117455617

Therm ID: IR 1; **Therm CF:** 1; **# of Coolers:** 1

Cooler Temps (Raw Measured) °C: Cooler 1: (1.4);

Cooler Temps (Corrected) °C: Cooler 1: (2.4);

Cooler Information	Y	or	N
1. Custody Seals Present	☑		☐
2. Custody Seals Intact	☑		☐
3. Temp criteria achieved	☑		☐
4. Cooler temp verification	IR Gun		
5. Cooler media	Ice (Bag)		

Trip Blank Information	Y	or	N	N/A
1. Trip Blank present / cooler	☑		☐	☐
2. Trip Blank listed on COC	☑		☐	☐

	W	or	S	N/A
3. Type Of TB Received	☑		☐	☐

Sample Information	Y	or	N	N/A
1. Sample labels present on bottles	☑		☐	
2. Samples preserved properly	☑		☐	
3. Sufficient volume/containers recvd for analysis:	☑		☐	
4. Condition of sample	Intact			
5. Sample recvd within HT	☑		☐	
6. Dates/Times/IDs on COC match Sample Label	☑		☐	
7. VOCs have headspace	☐		☑	☐
8. Bottles received for unspecified tests	☐		☑	
9. Compositing instructions clear	☐		☐	☑
10. Voa Soil Kits/Jars received past 48hrs?	☐		☐	☑
11. % Solids Jar received?	☐		☐	☑
12. Residual Chlorine Present?	☐		☐	☑

Misc. Information

Number of Encores: 25-Gram _____ 5-Gram _____ Number of 5035 Field Kits: _____ Number of Lab Filtered Metals: _____

Test Strip Lot #s: pH 0-3 230315 pH 10-12 219813A Other: (Specify) _____ _____

Residual Chlorine Test Strip Lot #: _____

SAMPLE DELIVERY GROUP CASE NARRATIVE

Client: Ahtna Environmental Inc **Job No:** FA67764

Site: Fort Ord Groundwater Monitoring **Report Date** 9/12/2019 3:02:59

3 Samples were collected on 09/04/2019 and were received at SGS North America Inc - Orlando on 09/06/2019 properly preserved, at 2.4 Deg. C and intact. These Samples received an SGS Orlando job number of FA67764. A listing of the Laboratory Sample ID, Client Sample ID and dates of collection are presented in the Results Summary Section. Except as noted below, all method specified calibrations and quality control performance criteria were met for this job. For more information, please refer to QC summary pages.

General Chemistry By Method EPA 300/SW846 9056A

Matrix: AQ **Batch ID:** GP33612

All samples were prepped within the recommended method holding time.

All samples were analyzed within the recommended method holding time.

All method blanks for this batch meet method specific criteria.

Sample(s) FA67730-6MSD, FA67730-6MS were used as the QC samples for Chloride.

Matrix Spike Recovery(s) for Chloride are outside control limits. Spike recovery indicates possible matrix interference.

Matrix Spike Duplicate Recovery(s) for Chloride are outside control limits. Probable cause is due to matrix interference.

SGS Orlando certifies that this report meets the project requirements for analytical data produced for the samples as received at SGS Orlando and as stated on the COC. SGS Orlando certifies that the data meets the Data Quality Objectives for precision, accuracy and completeness as specified in the SGS Orlando Quality Manual except as noted above. This report is to be used in its entirety. SGS Orlando is not responsible for any assumptions of data quality if partial data packages are used.

Location Id	Lab Batch	Sample Date	Sample Number	Sample Depth	Matrix	Method	Analyte	Units	Result	Quantitation Limit	Limit of Detection	Non Detect	Lab Qual	Val Qual

Acronyms and Abbreviations:

ug/m^3: micrograms per cubic meter

Qual: qualifier

ND: Non Detect

SG: Soil Gas

Data Validation Qualifiers:

J: Laboratory qualifier, estimated result between the detection limit (DL) and the limit of quantification (LOQ) with a possible high (+) or low (-) bias.

U: Laboratory or validation qualifier, concentration not detected (reported as <LOD).

SUBJECT: Fort Ord, Site 12, Data Validation

Dear Mr. Schmidt,

Enclosed is the final validation report for the fraction listed below. This SDG was received on September 16, 2019. Attachment 1 is a summary of the samples that were reviewed for analysis.

LDC Project #45945:

SDG #	Fraction
1908555	Volatiles

The data validation was performed under Level III & IV guidelines. The analyses were validated using the following documents, as applicable to each method:

- Final Quality Assurance Project Plan Volume I, Appendix A for Groundwater Remedies and Monitoring at Operable Unit 2, Sites 2 and 12, and Operable Unit Carbon Tetrachloride Plume, Former Fort Ord, California; Revision7, August 2019
- U.S. Department of Defense Quality Systems Manual for Environmental Laboratories, Version 5.1; 2017
- USACE Guidance for Evaluating Performance-Based Chemical Data; June 2005
- USEPA National Functional Guidelines for Superfund Organic Methods Data Review; January 2017

Please feel free to contact us if you have any questions.

Sincerely,

Pei Geng
Pgeng@lab-data.com
Project Manager/Senior Chemist

INTRODUCTION

This Data Validation Report (DVR) presents Level III and Level IV data validation results for samples collected during the August 2019 sampling period. Data validation was performed in accordance with the Final Quality Assurance Project Plan Volume I, Appendix A for Groundwater Remedies and Monitoring at Operable Unit 2, Sites 2 and 12, and Operable Unit Carbon Tetrachloride Plume, Former Fort Ord, California (Revision 7, August 2019), the U.S. Department of Defense (DoD) Quality Systems Manual (QSM) for Environmental Laboratories, Version 5.1 (2017), the USACE Guidance for Evaluating Performance-Based Chemical Data (June 2005), and a modified outline of the USEPA National Functional Guidelines (NFG) for Organic Superfund Method Data Review (January 2017). Where specific guidance is not available, the data has been evaluated in a conservative manner consistent with industry standards using professional experience.

The analyses were performed by the following method:

Volatiles (VOCs) by Environmental Protection Agency (EPA) Method TO-15

The sample identification and method of analyses performed on each sample is presented in Attachment 1. Overall data qualification summary is presented in Attachment 2. Level III Automated Data Review outliers are presented in Enclosure I. DVRs for samples on which Level IV validation was performed are presented in Enclosure II.

All sample results were subjected to Level III data validation, which comprises an evaluation of quality control (QC) summary results for sample holding times, initial and continuing calibrations, surrogates, internal standards, duplicate sample analysis (DUP), laboratory control sample/laboratory control sample duplicates (LCS/LCSD), laboratory blanks, and field duplicate samples. Approximately 10 percent of samples were subjected to Level IV evaluation as indicated in Attachment 1, which comprised a review of the QC summary forms as well as the raw data, to confirm sample quantitation and identification.

Automated data review was performed on all QC summary results using the Automated Data Review (ADR.net) software program (LDC, 2013). Quality assurance (QA)/QC criteria specified in the QAPP, EM-200-1-10, and NFG were incorporated with the program's reference library to assess compliance with project requirements.

The following are definitions of the data qualifiers utilized during data validation:

J+ (Estimated, High Bias): The compound or analyte was analyzed for and positively identified by the laboratory; however the reported concentration is estimated, displaying high bias, due to non-conformances discovered during data validation.

J- (Estimated, Low Bias): The compound or analyte was analyzed for and positively identified by the laboratory; however the reported concentration is estimated, displaying low bias, due to non-conformances discovered during data validation.

J (Estimated, Bias Indeterminate): The compound or analyte was analyzed for and positively identified by the laboratory; however the reported concentration is estimated due to non-conformances discovered during data validation. Bias is indeterminate.

U (Non-detected): The compound or analyte was analyzed for and positively identified by the laboratory; however the analyte should be considered non-detect at the reported concentration due to the presence of contaminants detected in the associated blank(s).

UJ (Non-detected estimated): The compound or analyte was reported as not detected by the laboratory; however the reported quantitation/detection limit is estimated due to non-conformances discovered during data validation.

R (Rejected): The sample results were rejected due to gross non-conformances discovered during data validation. Data qualified as rejected is not usable.

NA (Not applicable): The non-conformance discovered during data validation demonstrates a high bias, while the affected compound or analyte in the associated sample(s) was reported as not detected by the laboratory and did not warrant the qualification of the data.

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

I. Sample Receipt & Technical Holding Times

All canisters were properly pressurized and handled.

All technical holding time requirements were met.

II. Instrument Performance Check

Instrument performance was checked at the frequency required by the method.

All criteria for the instrument performance check were met.

III. Initial Calibration and Initial Calibration Verification

All criteria for the initial calibration and initial calibration verifications of the method were met.

IV. Continuing Calibration

All criteria for the continuing calibration of the method were met.

V. Laboratory Blanks

Laboratory blanks were analyzed as required by the method. No contaminants were found in the laboratory blanks.

All canisters were cleaned as required by the method. The laboratory indicated that canister certification was performed by batch. No contaminants were found in the representative canister blank.

VI. Field Blanks

No field blanks were identified in this SDG.

VII. Surrogates

Although surrogates were not required by the method, surrogate analysis was performed by the laboratory. Surrogate recoveries (%R) were within QC limits.

VIII. Matrix Spike/Matrix Spike Duplicates

Matrix spike (MS) and matrix spike duplicate (MSD) analysis was not required per the method.

IX. Duplicate Sample Analysis

Duplicate (DUP) sample analysis was performed on an associated project sample. Results were within QC limits.

X. Laboratory Control Samples

Laboratory control samples (LCS) and laboratory control sample duplicates (LCSD) were analyzed as required by the method. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

XI. Field Duplicates

Two field duplicate pairs were collected and analyzed for VOCs. All RPDs were within QC limits. The field duplicate result comparisons are provided in Enclosures I and II.

XII. Internal Standards

All internal standard areas and retention times were within QC limits.

XIII. Compound Quantitation

The laboratory reporting limits were evaluated. All laboratory reporting limits met the specified requirements.

All compounds reported below the LOQ as detected by the laboratory were qualified as detected estimated (J). The details regarding the qualification of data are provided in Enclosures I and II.

XIV. Overall Assessment of Data

The analysis was conducted within all specifications of the method. No results were rejected in this SDG.

Due to results below the LOQ, data were qualified as estimated four samples.

The quality control criteria reviewed, other than those discussed above, were met and are considered acceptable.

Data flags are summarized and are presented as Attachment 2.

Level IV Data Validation Reports

Laboratory Data Consultants, Inc.
Data Validation Report

Project/Site Name: Fort Ord, Site 12

LDC Report Date: October 2, 2019

Parameters: Volatiles

Validation Level: Level IV

Laboratory: Eurofins

Sample Delivery Group (SDG): 1908555

Sample Identification	Laboratory Sample Identification	Matrix	Collection Date
1934A212024F	1908555-02	Air	08/19/19
1934A212025F	1908555-03	Air	08/19/19

Introduction

This Data Validation Report (DVR) presents data validation findings and results for the associated samples listed on the cover page. Data validation was performed in accordance with the Final Quality Assurance Project Plan Volume I, Appendix A for Groundwater Remedies and Monitoring at Operable Unit 2, Sites 2 and 12, and Operable Unit Carbon Tetrachloride Plume, Former Fort Ord, California (Revision 7, August 2019), the U.S. Department of Defense (DoD) Quality Systems Manual (QSM) for Environmental Laboratories, Version 5.1 (2017), and the USACE Guidance for Evaluating Performance-Based Chemical Data (June 2005). Where specific guidance was not available, the data has been evaluated in a conservative manner consistent with industry standards using professional experience.

The analyses were performed by the following method:

Volatile Organic Compounds (VOCs) by Environmental Protection Agency (EPA) Method TO-15

All sample results were subjected to Level IV data validation, which is comprised of the quality control (QC) summary forms as well as the raw data, to confirm sample quantitation and identification.

The following are definitions of the data qualifiers utilized during data validation:

J+ (Estimated, High Bias): The compound or analyte was analyzed for and positively identified by the laboratory; however the reported concentration is estimated, displaying high bias, due to non-conformances discovered during data validation.

J- (Estimated, Low Bias): The compound or analyte was analyzed for and positively identified by the laboratory; however the reported concentration is estimated, displaying low bias, due to non-conformances discovered during data validation.

J (Estimated, Bias Indeterminate): The compound or analyte was analyzed for and positively identified by the laboratory; however the reported concentration is estimated due to non-conformances discovered during data validation. Bias is indeterminate.

U (Non-detected): The compound or analyte was analyzed for and positively identified by the laboratory; however the compound or analyte should be considered non-detected at the reported concentration due to the presence of contaminants detected in the associated blank(s).

UJ (Non-detected estimated): The compound or analyte was reported as not detected by the laboratory; however the reported quantitation/detection limit is estimated due to non-conformances discovered during data validation.

R (Rejected): The sample results were rejected due to gross non-conformances discovered during data validation. Data qualified as rejected is not usable.

NA (Not Applicable): The non-conformance discovered during data validation demonstrates a high bias, while the affected compound or analyte in the associated sample(s) was reported as not detected by the laboratory and did not warrant the qualification of the data.

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

I. Sample Receipt and Technical Holding Times

All samples were received in good condition.

All technical holding time requirements were met.

II. GC/MS Instrument Performance Check

A bromofluorobenzene (BFB) tune was performed at 24 hour intervals.

All ion abundance requirements were met.

III. Initial Calibration and Initial Calibration Verification

An initial calibration was performed as required by the method.

The percent relative standard deviations (%RSD) were less than or equal to 30.0% for all compounds.

The percent differences (%D) of the initial calibration verification (ICV) standard were less than or equal to 30.0% for all compounds.

IV. Continuing Calibration

Continuing calibration was performed at the required frequencies.

The percent differences (%D) were less than or equal to 30.0% for all compounds.

The percent differences (%D) of the ending continuing calibration verifications (CCVs) were less than or equal to 50.0% for all compounds.

V. Laboratory Blanks

Laboratory blanks were analyzed as required by the method. No contaminants were found in the laboratory blanks.

All canisters were cleaned as required by the method. The laboratory indicated that canister certification was performed by batch. No contaminants were found in the representative canister blank.

VI. Field Blanks

No field blanks were identified in this SDG.

VII. Surrogates

Although surrogates were not required by the method, surrogate analysis was performed by the laboratory. Surrogate recoveries (%R) were within QC limits.

VIII. Duplicate Sample Analysis

Duplicate (DUP) sample analysis was performed on an associated project sample. Results were within QC limits.

IX. Laboratory Control Samples

Laboratory control samples (LCS) and laboratory control samples duplicates (LCSD) were analyzed as required by the method. Percent recoveries (%R) were within QC limits. Relative percent differences (RPD) were within QC limits.

X. Field Duplicates

Samples 1934A212025F and 1934A212026D were identified as field duplicates. No results were detected in any of the samples with the following exceptions:

Compound	Concentration (ug/m³)		RPD (Limits)
	1934A212025F	1934A212026D	
Tetrachloroethene	62	66	6 (≤30)
Trichloroethene	580	570	2 (≤30)

XI. Internal Standards

All internal standard areas and retention times were within QC limits.

XII. Compound Quantitation

All compound quantitations met validation criteria.

All compounds reported below the LOQ were qualified as follows:

Sample	Finding	Flag	A or P
1934A212024F 1934A212025F	All compounds reported below the LOQ.	J (all detects)	A

XIII. Target Compound Identifications

All target compound identifications met validation criteria.

XIV. System Performance

The system performance was acceptable.

XV. Overall Assessment of Data

The analysis was conducted within all specifications of the method. No results were rejected in this SDG.

Due to results below the LOQ, data were qualified as estimated in two samples.

The quality control criteria reviewed, other than those discussed above, were met and are considered acceptable.

Reviewer: EA
2nd Reviewer: RW

Method: Volatiles (EPA Method TO-15)

Validation Area	Yes	No	NA	Findings/Comments
I. Technical holding times				
Were all technical holding times met?	✓			
Was canister pressure criteria met?	✓			
II. GC/MS Instrument performance check				
Were the BFB performance results reviewed and found to be within the specified criteria?	✓			
Were all samples analyzed within the 24 hour clock criteria?	✓			
IIIa. Initial calibration				
Did the laboratory perform a 5 point calibration prior to sample analysis?	✓			
Were all percent relative standard deviations (%RSD) ≤ 30%?	✓			
IIIb. Initial calibration verification				
Was an initial calibration verification standard analyzed after every ICAL for each instrument?	✓			
Were all percent differences (%D) ≤ 30% or percent recoveries (%R) 70-130%?	✓			
IV. Continuing calibration				
Was a continuing calibration standard analyzed at least once every 24 hours for each instrument?	✓			
Were all percent differences (%D) ≤ 30% or percent recoveries (%R) 70-130%?	✓			
V. Laboratory Blanks/Canister Blanks				
Was a laboratory blank associated with every sample in this SDG?	✓			
Was a laboratory blank analyzed at least once every 24 hours for each matrix and concentration?	✓			
Was there contamination in the laboratory blanks? If yes, please see the Blanks validation findings worksheet.		✓		
Was a canister blank analyzed for every canister?	✓			
Was there contamination in the canister blanks? If yes, please see the Canister Blanks validation findings worksheet.		✓		
VI. Field Blanks				
Were field blanks identified in this SDG?		✓		
Were target compounds detected in the field blanks?			✓	
VII. Surrogate spikes (Optional)				
Were all surrogate percent recoveries (%R) within QC limits?	✓			
If the percent recovery (%R) for one or more surrogates was out of QC limits, was a reanalysis performed to confirm samples with %R outside of criteria?			✓	
VIII. Laboratory Duplicate				
Was a laboratory duplicate analyzed for this SDG?	✓			
Were the relative percent differences (RPD) within the QC limits?	✓			

LDC #: 45945A45

VALIDATION FINDINGS CHECKLIST

Page: 2 of 2
Reviewer: 2
2nd Reviewer: RW

Validation Area	Yes	No	NA	Findings/Comments
IX. Laboratory control samples				
Was an LCS analyzed for this SDG?	✓			
Was an LCS analyzed per analytical batch?	✓			
Were the LCS percent recoveries (%R) and relative percent difference (RPD) within the QC limits?	✓			
X. Field duplicates				
Were field duplicate pairs identified in this SDG?	✓			
Were target compounds detected in the field duplicates?	✓			
XI. Internal standards				
Were internal standard area counts within ± 40% from the associated calibration standard?	✓			
Were retention times within ± 20.0 seconds from the associated calibration standard?	✓			
XII. Compound quantitation				
Did the laboratory LOQs/RLs meet the QAPP LOQs/RLs?	✓			
Were the correct internal standard (IS), quantitation ion and relative response factor (RRF) used to quantitate the compound?	✓			
Were compound quantitation and RLs adjusted to reflect all sample dilutions applicable to level IV validation?	✓			
XIII. Target compound identification				
Were relative retention times (RRT's) within ± 0.06 RRT units of the standard?	✓			
Did compound spectra meet specified EPA "Functional Guidelines" criteria?	✓			
Were chromatogram peaks verified and accounted for?	✓			
XIV. System performance				
System performance was found to be acceptable.	✓			
XV. Leak check compounds				
Was a leak check compound used to evaluate sample integrity and included in the laboratory analyte list?		✓		
Was the leak check compound detected in the samples? If yes, please see leak check validation findings worksheet.			✓	
XV. Overall assessment of data				
Overall assessment of data was found to be acceptable.	✓

The Relative Response Factor (RRF), average RRF, and percent relative standard deviation (%RSD) were recalculated for the compounds identified below using the following calculations:

$RRF = (A_x)(C_{is})/(A_{is})(C_x)$
average RRF = sum of the RRFs/number of standards
%RSD = 100 * (S/X)

A_x = Area of compound,
C_x = Concentration of compound,
S = Standard deviation of the RRFs
X = Mean of the RRFs

A_{is} = Area of associated internal standard
C_{is} = Concentration of internal standard

#	Standard ID	Calibration Date	Compound (Reference Internal Standard)	Reported RRF (200 std)	Recalculated RRF (200 std)	Reported Average RRF (initial)	Recalculated Average RRF (initial)	Reported %RSD	Recalculated %RSD

METHOD: GC/MS VOA (EPA TO-15)

The percent difference (%D) of the initial calibration average Relative Response Factors (RRFs) and the continuing calibration RRFs were recalculated for the compounds identified below using the following calculation:

% Difference = 100 * (ave. RRF - RRF)/ave. RRF
$RRF = (A_x)(C_{is})/(A_{is})(C_x)$

Where: ave. RRF = initial calibration average RRF
RRF = continuing calibration RRF
A_x = Area of compound, A_{is} = Area of associated internal standard
C_x = Concentration of compound, C_{is} = Concentration of internal standard

LABORATORY NARRATIVE
DoD QSM - TO-15
AHTNA
Workorder# 1908555

Eighteen 1 Liter Summa Canister samples were received on August 23, 2019. The laboratory performed analysis via EPA Method TO-15 using GC/MS in the full scan mode.

This workorder was independently validated prior to submittal using 'USEPA National Functional Guidelines' as generally applied to the analysis of volatile organic compounds in air. A rules-based, logic driven, independent validation engine was employed to assess completeness, evaluate pass/fail of relevant project quality control requirements and verification of all quantified amounts.

Receiving Notes

There were no receiving discrepancies.

Analytical Notes

As per project specific client request the laboratory has reported estimated values for target compound hits that are below the Reporting Limit but greater than the Limit of Detection (LOD). Concentrations that are below the level at which the canister was certified may be false positives.

Samples were analyzed in analytical batch on MSD-14 on 8/29/19. The initial continuing calibration verification (CCV) for the batch is reported as lab fraction 20A and the ending CCV is reported as lab fraction 20B.

Definition of Data Qualifying Flags

Eight qualifiers may have been used on the data analysis sheets and indicates as follows:

B - Compound present in laboratory blank greater than reporting limit (background subtraction not performed).

J - Estimated value.

S - Saturated peak.

Q - Exceeds quality control limits.

U - Compound analyzed for but not detected above the reporting limit, LOD, or MDL value. See data page for project specific U-flag definition.

UJ- Non-detected compound associated with low bias in the CCV

N - The identification is based on presumptive evidence.

File extensions may have been used on the data analysis sheets and indicates as follows:

a-File was requantified

b-File was quantified by a second column and detector

r1-File was requantified for the purpose of reissue

Initial Calibration Narrative

14950821A.M

An initial calibration was performed on 08/21/19.

ICAL: 2 out.
3-Chloropropene @ 33.5%
Hexachlorobutadiene @ 34.0%
Naph w/in 70-130%

Level #4 reanalyzed due to anomalous linearity

Propylene raised RL to 50ppbv

ICV: File 14082125; **0 out.**
Naph w/in 70-130%

DOD and In-House controls:

- **DOD 5.0/5.1- 0 out, File# 14082125a**
- **DOD 4.2- 0 out, File# 14082125c**
- **RPC 1 out, 1,2,4 Trichlorobenzene @ 79.3% File # 14082125d**
- **DODsp. File# 14082125e**

The upper end of the curve is 10,000ppbv for the following compounds:

1. Butane
2. Freon 11
3. Ethanol
4. Freon 113
5. 1,1 Dichloroethene
6. Acetone
7. 2-propanol
8. Methylene Chloride
9. MTBE
10. Hexane
11. 1,1- Dichlorethane
12. Cis-1,2- Dichlroethene
13. Chloroform
14. Cyclohexane
15. 1,1,1- Trichlorethane
16. Carbon Tetrachloride
17. 2,2,4 –Trimethylpentane
18. Benzene
19. Heptane
20. Trichloroethane
21. Methylcyclohexane
22. Toluene
23. Tetrachloroethene
24. Ethyl Benzene
25. M,p-Xylene
26. O-Xylene
27. 1.3.5- Trimethylbenzene
28. 1,2,4- Trimethylbenzene
29. Isopentane

All other compounds within TO-15 standards were calibrated up to **1,000 ppbv** only

Propylene: 50ppbv → 1000ppbv **(4-point Calibration)**

Naph.: 10 ppbv → 500 ppbv

Oxygenates: 20 ppbv →200 ppbv **(4-point Calibration)**

A 5-point **Master Combo** curve was analyzed on 8/21/19 at levels: 20ppbv, 50ppbv, 100ppbv, 200ppbv, 1000ppbv.

No Idomethane, Propane, 1,3,5-Trichlorobenzene and 1,2,3-Trichlorobenzene.

Hexachloroethane, 1,2 Dibromo 3-chloropropane, and Dodecane have an RL of 50ppbv.

Eurofins Air Toxics | **MSD-14** | **Logbook #3105**

IS and Associated Target Compounds and Surr.
Instruction #: I1.20

Modified EPA Methods TO-14A/TO-15
Internal Standard and Associated Target Compounds and Surrogates

Bromochloromethane*
Target Compounds:
Freon 12
Freon 114
Chloromethane
Vinyl Chloride
1,3-Butadiene
Bromomethane
Chloroethane
Freon 11
Ethanol
Freon 113
1,1-Dichloroethene
Acetone
2-Propanol
Carbon Disulfide
3-Chloropropene
Methylene Chloride
Methyl tert-butyl ether
trans-1,2-Dichloroethene
Hexane
1,1-Dichloroethane
2-Butanone (Methyl Ethyl Ketone)
cis-1,2-Dichloroethene
Tetrahydrofuran
Chloroform
1,1,1-Trichloroethane
Cyclohexane
Carbon Tetrachloride
2,2,4-Trimethylpentane
Surrogates:
1,2-Dichloroethane-d4

1,4-Difluorobenzene
Target Compounds:
Benzene
1,2-Dichloroethane
Heptane
Trichloroethene
1,2-Dichloropropane
1,4-Dioxane
Bromodichloromethane
cis-1,3-Dichloropropene
4-Methyl-2-pentanone
Toluene
Surrogates:
Toluene-d8

Chlorobenzene-d5
Target Compounds:
trans-1,3-Dichloropropene
1,1,2-Trichloroethane
Tetrachloroethene
2-Hexanone
Dibromochloromethane
1,2-Dibromoethane (EDB)
Chlorobenzene
Ethyl Benzene
m,p-Xylene
o-Xylene
Styrene
Bromoform
Cumene
1,1,2,2-Tetrachloroethane
Propylbenzene
4-Ethyltoluene
1,3,5-Trimethylbenzene
1,2,4-Trimethylbenzene
1,3-Dichlorobenzene
1,4-Dichlorobenzene
alpha-Chlorotoluene
1,2-Dichlorobenzene
1,2,4-Trichlorobenzene
Hexachlorobutadiene
Surrogates:
Bromofluorobenzene

*Note: If Bromochloromethane (BCM) is required as a target compound, the internal standard mix is blended without BCM. Compounds and surrogates assigned to BCM are re-assigned to 1,4-Difluorobenzene for calibration and subsequent quantitation.

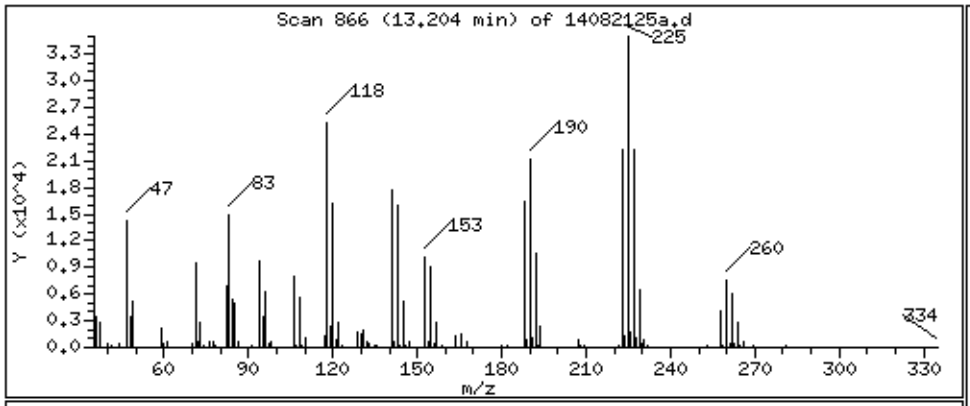
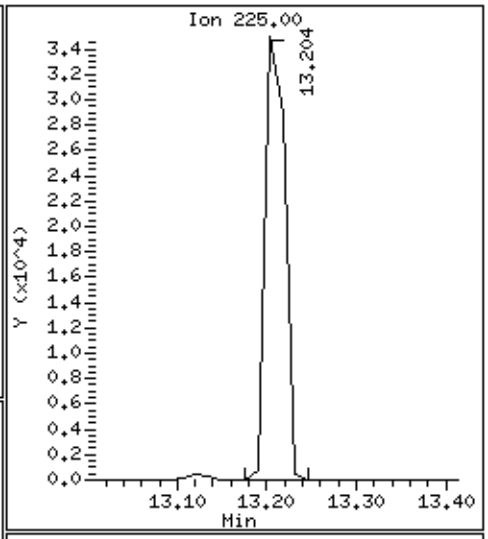
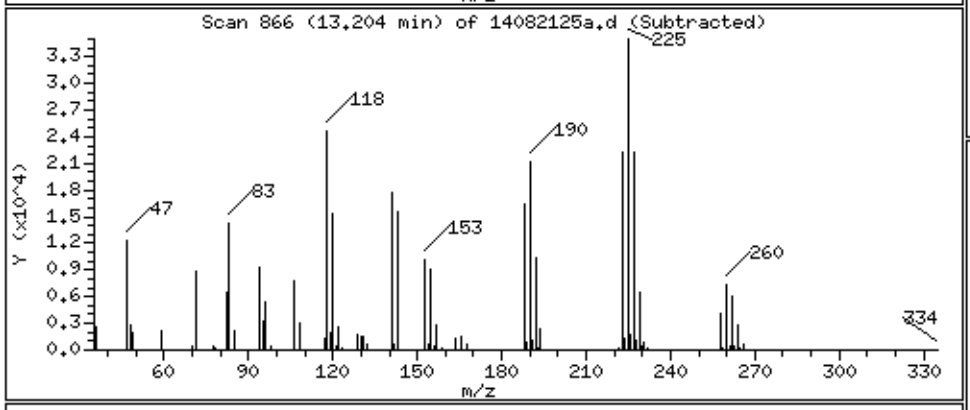
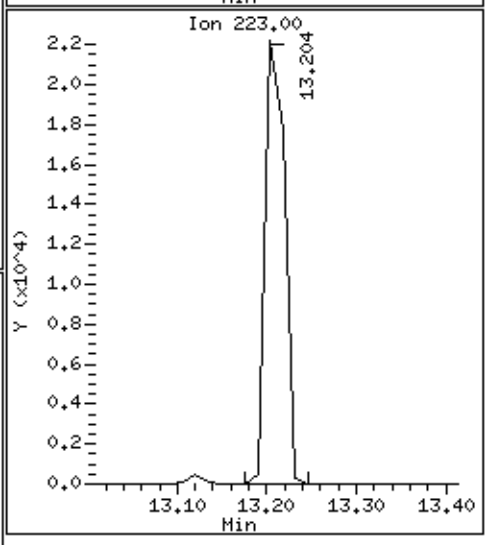
234 Hexachlorobutadiene

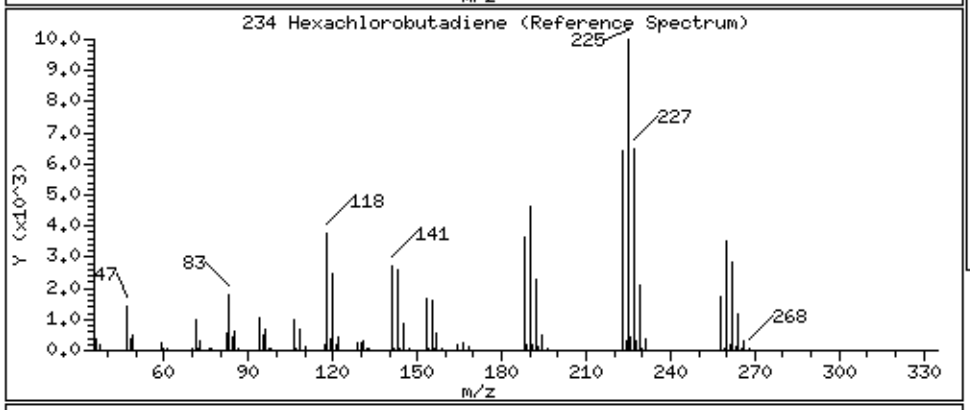
Concentration: 176.99 PPBV

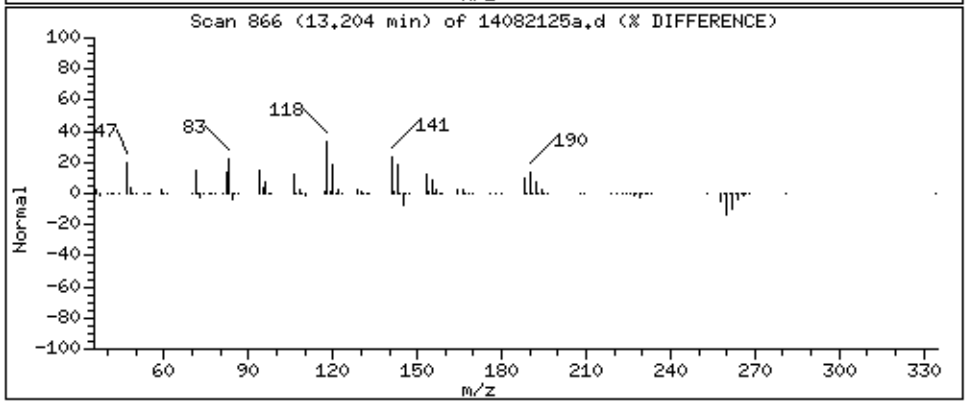












Data File: /chem1/msd14.i/21AUG19.b/14082125a.d

Date : 22-AUG-2019 08:23

Client ID: ICV

Instrument: msd14.i

Sample Info: 50mL #3018-871

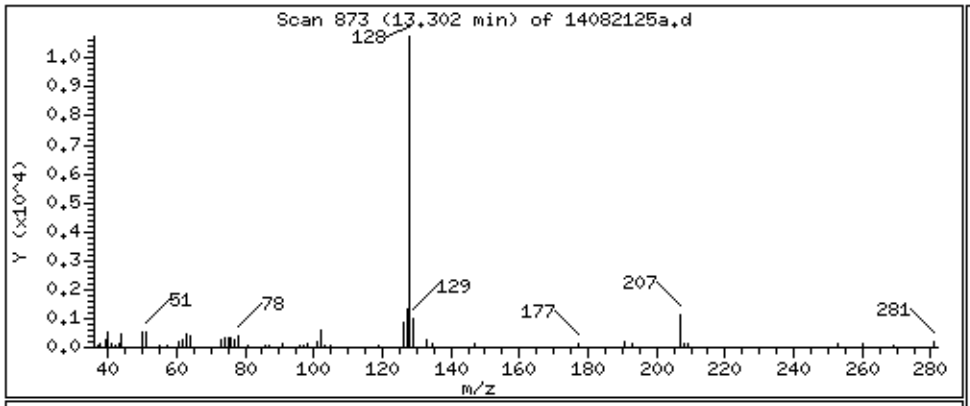
Operator: AK

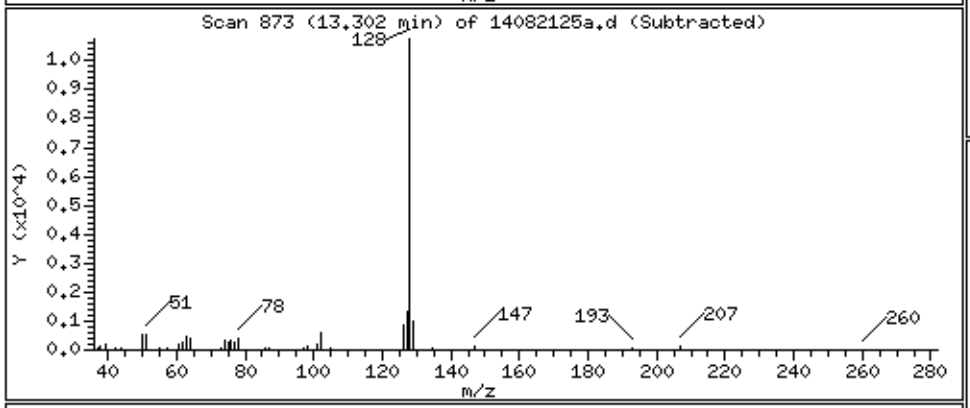
Column phase: RTX-624

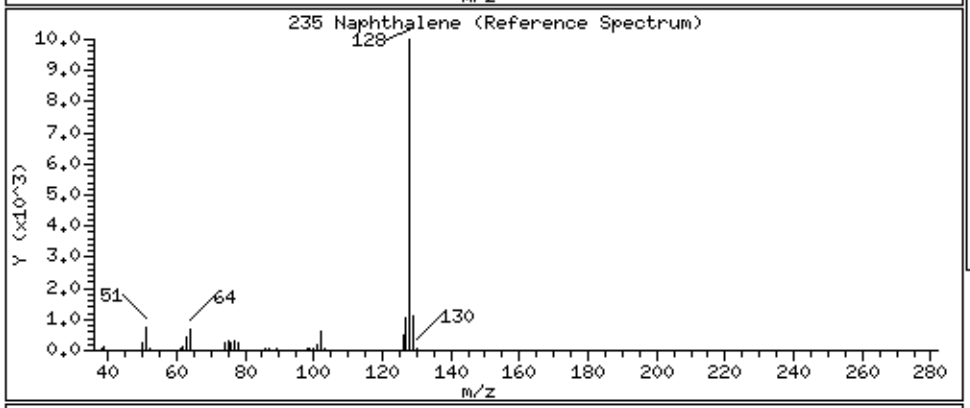
Column diameter: 0.18

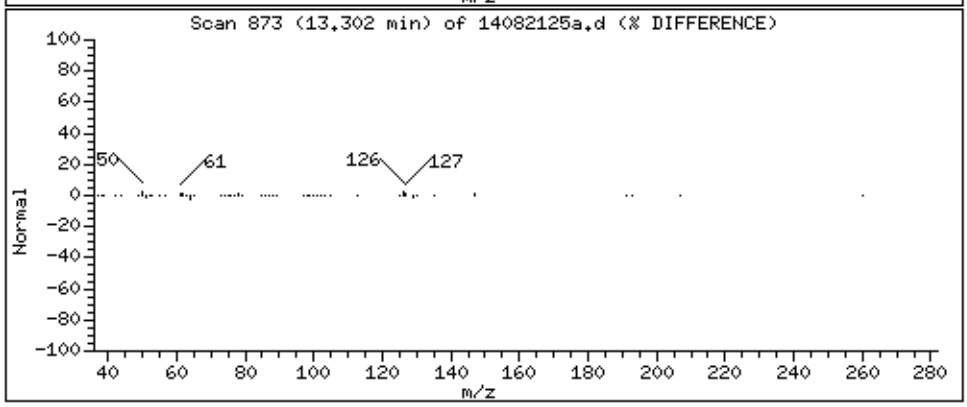
235 Naphthalene

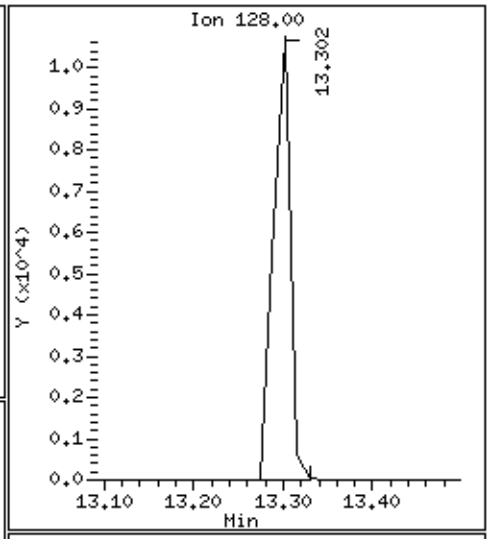
Concentration: 17.438 PPBV

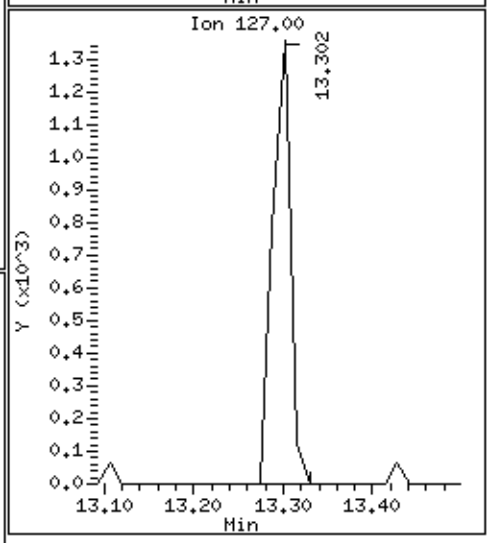












US32APPTV002

EPA TO-15/MODIFIED TO14A

Data file : /chem1/msd14.i/21AUG19.b/14082112.d
Lab Smp Id: ICAL Level #2 Client Smp ID: ICAL Level #2
Inj Date : 21-AUG-2019 17:39
Operator : DF Inst ID: msd14.i
Smp Info : 50ml #3018-848
Misc Info : 5.0ppbv (5.0ppbv)
Comment : 5 and 20 - GC/MS
Method : /chem1/msd14.i/21AUG19.b/14950821a.m
Meth Date : 23-Aug-2019 08:58 ikh2 Quant Type: ISTD
Cal Date : 21-AUG-2019 17:39 Cal File: 14082112.d
Als bottle: 1 Calibration Sample, Level: 2
Dil Factor: 1.00000
Integrator: HP RTE Compound Sublist: Level2.sub
Sample Matrix: AIR
Processing Host: us32apptv003

Concentration Formula: Amt * DF * CpndVariable

QC Flag Legend

a - Target compound detected but, quantitated amount
    Below Limit Of Quantitation(BLOQ).
M1- Compound response manually integrated because
    Target system did not integrate.

US32APPTV002

Smp Info : 2.5ml #3084-162
Misc Info : 50ppbv(1000ppbv)
Comment : 5 and 20 - GC/MS
Method : /chem1/msd14.i/21AUG19.b/14950821a.m
Meth Date : 23-Aug-2019 07:25 ikh2 Quant Type: ISTD
Cal Date : 22-AUG-2019 09:28 Cal File: 14082127.d
Als bottle: 1 Calibration Sample, Level: 4
Dil Factor: 1.00000
Integrator: HP RTE Compound Sublist: MasterCRV.sub
Sample Matrix: AIR
Processing Host: us32apptv003

Concentration Formula: Amt * DF * CpndVariable

Cpnd Variable Local Compound Variable

RT	EXP RT (REL RT)	MASS	RESPONSE	AMOUNTS CAL-AMT (PPBV)	ON-COL (PPBV)	TARGET RANGE	RATIO

AREA AND RT SUMMARY

Instrument ID: msd14.i
Lab File ID: 14082903a.d
Lab Smp Id: LCS
Analysis Type: VOA
Quant Type: ISTD
Operator: AK
Method File: /chem1/msd14.i/29AUG19.b/14950821a.m
Misc Info: 200ppbv (200ppbv)

Calibration Date: 29-AUG-2019
Calibration Time: 08:30
Client Smp ID: LCS
Level: LOW
Sample Type: AIR

Eurofins Air Toxics, Inc. Sample Receipt Confirmation Cover Page

Thank you for choosing Eurofins Air Toxics, Inc. (EATL). We have received your samples and have listed any Sample Receipt Descrepancies below.

In order to expedite analysis and reporting, please review the attached information for accuracy.

For corrections call: **Air Toxics, Ltd. at 916-985-1000**

EATL will proceed with the analysis as specified on the Chain of Custody (COC) and Sample Receipt Summary page.

Please note : The Sample Receipt Confirmation, including the total workorder charge, is subject to change upon secondary review. Our aim is to provide a confirmation to you in a timely manner. Sample Receipt Discrepancies, if any, may not include discrepancies regarding sample receipt pressure(s). Additionally, the COC will be provided with the final report.

Subject: EATL Variance

Hi Holly,
Thanks for speaking to me about the start of the project. Can you please confirm that Ahtna has no objections to the included variances?

Kyle Vagadori
Project Manager

Description: Pore Volume Calculations Sites 2/12 Groundwater and Soil Gas Monitoring and Treatment System Report
Prepared By: S. KOSOWSKI

Date 3/13/20

Assumptions: Effective Porosity (n_e) 30 to 35% = 0.30 to 0.35
Depth to Water Table in EW-12-08-180U on 8/28/19 = 66.17 feet; Well Depth: 120 feet
Saturated Thickness (H) = 120 - 66.17 = 53.83 feet
Area (A) Impacted by PCE Plume: 167 ft. x 167 feet = 27,889 ft^2

1 pore volume of contaminated Groundwater:
$V = A \times H \times n_e$ = 27,889 ft^2 x 53.83 feet x 0.35 =
= 525,443 ft^3 x 7.48 = 3,930,311 gallons
V_1 = 15 x 3,930,311 gallons = 58,954,665.0 gallons
Average Pumping Rate at EW-12-08-180U = 43.0 gpm
To reach the ACL for PCE at 5 µg/L it will take approximately 15 pore volumes that needs to be extracted and treated.

I. Time needed to extract and treat PCE contaminated plume at current EW-12-08-180U extraction rate:
T = 43 gpm (current extraction rate) x 60 x 24 =
= 61,920 gallons/day =>
$T_t = \frac{V_1}{T} = \frac{58,954,665.0}{61,920}$ = 952 days / 365 = 2.61 years

II. Time needed to extract and treat PCE contaminated plume at increased (90 gpm) EW-12-08-180U extraction rate:

Prepared By: S. KOSAWSKI

Date 3/13/20

$T = 90\ gpm$ (increased extraction rate) $\times 60 \times 24 =$

$= 129,600$ gallons / day $\Rightarrow$

$T_r = \frac{V_1}{T} = \frac{58,954,665.0}{129,600} = 455$ days / 365 =

≈ 1.25 years, To allow for aquifer heterogenity, effective porosities, nature of contaminant, and limitations due to Sorption, tailing, hydraulic conductivity variations, the estimated cleanup time was increased to 2 years
